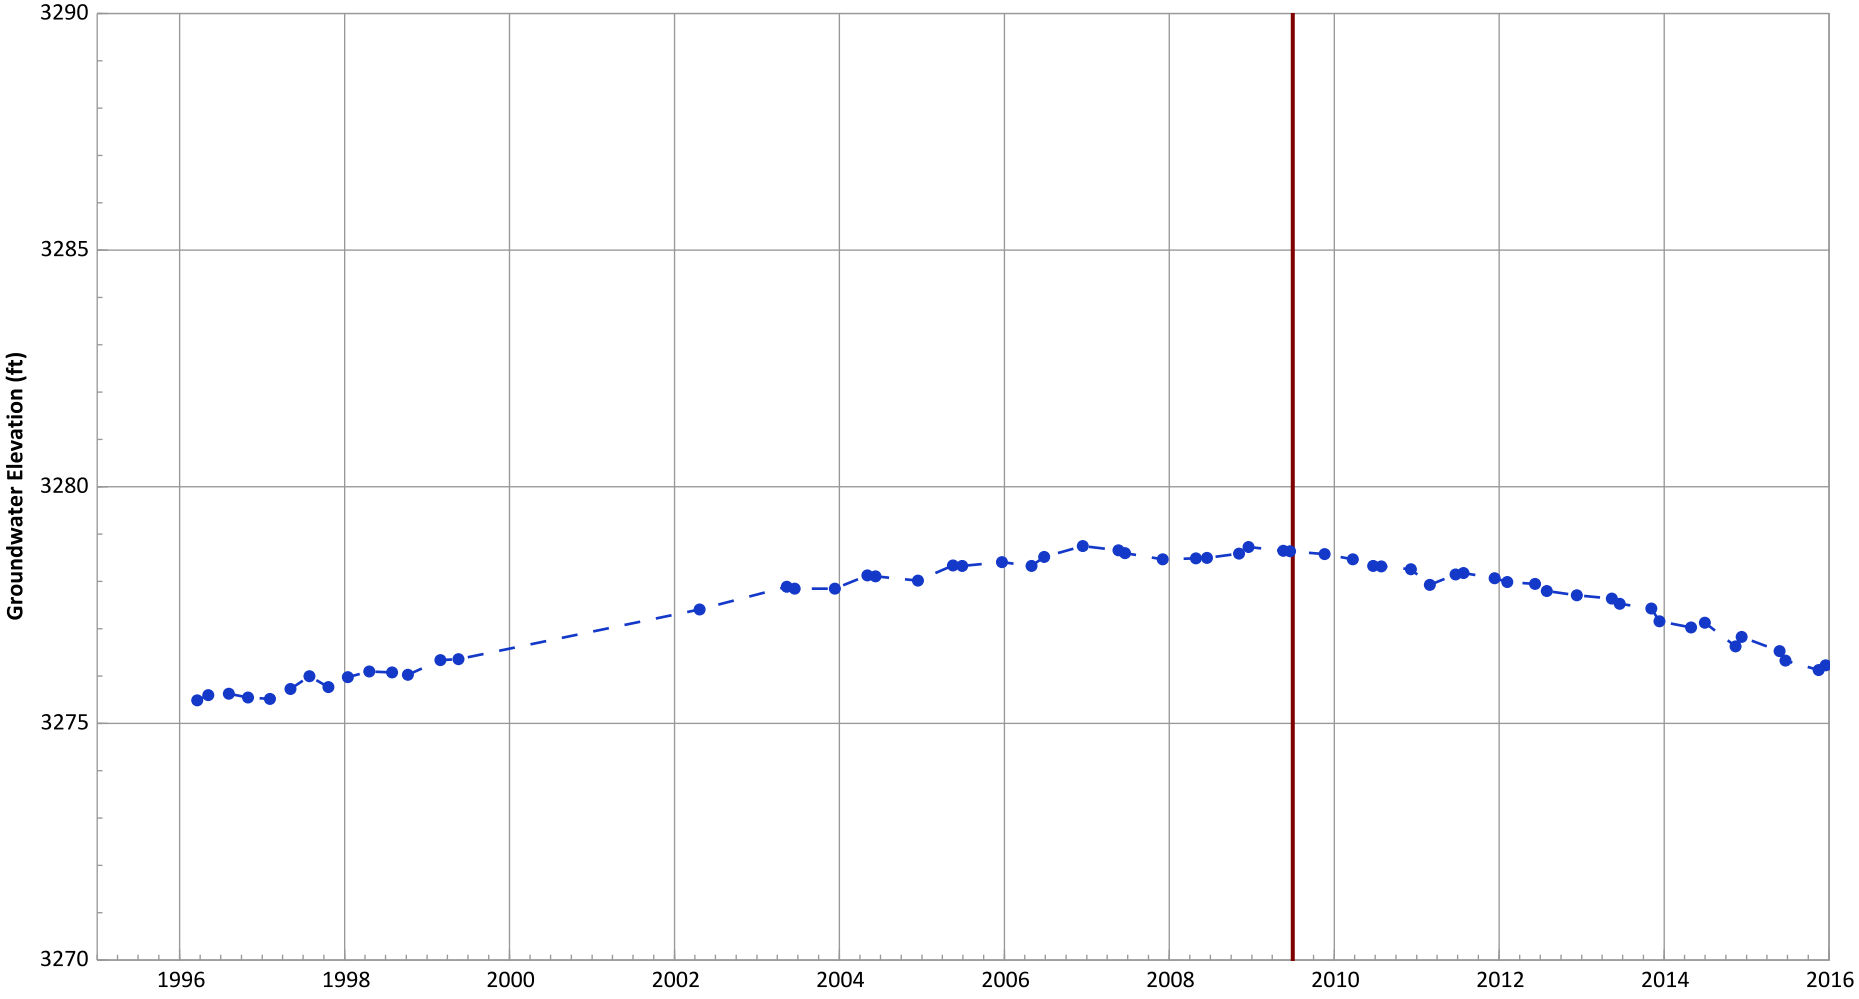
UM = Uncertainty management

PS = Plume stability

RAE = Response action effectiveness

1114-MW4 Hydrograph in Perched Aquifer
USDOE/NNSA Pantex Plant



Notes:
1. Top of screen elevation is 3280.32 ft msl.
2. The bottom of screen elevation is 3260.32 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

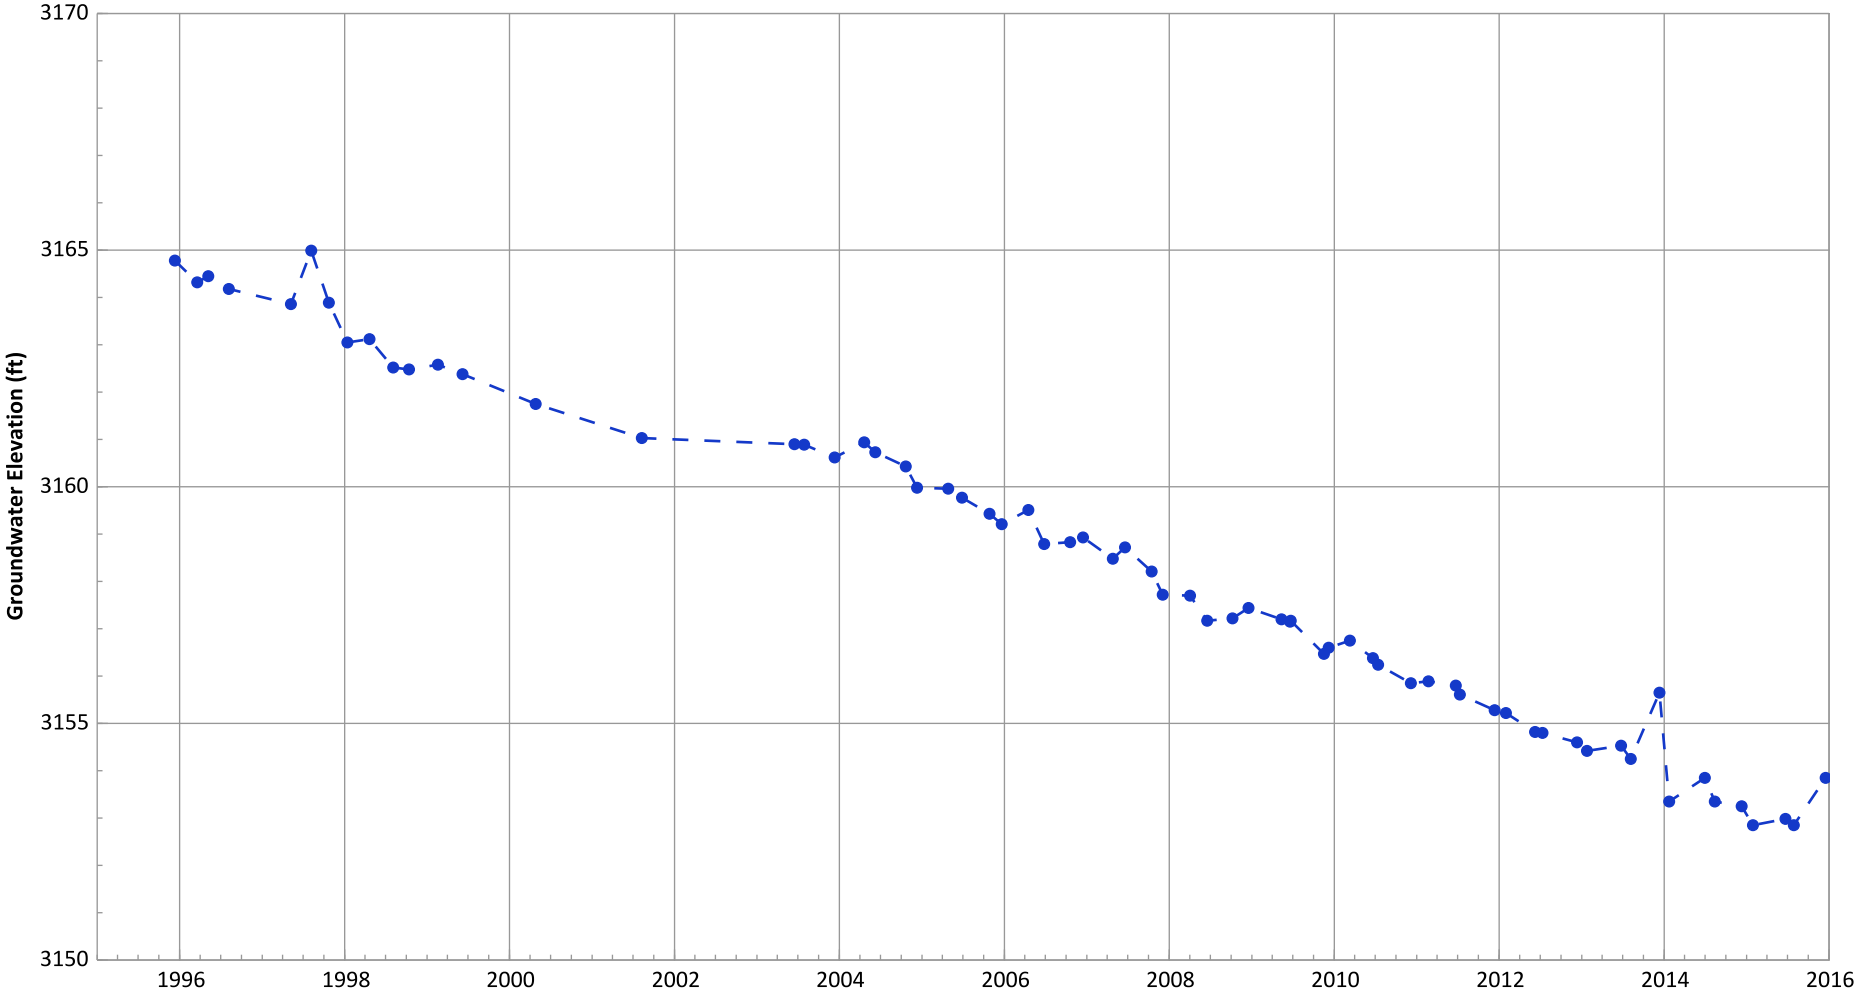
Ogallala Aquifer Hydrographs

PTX-BEG2 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

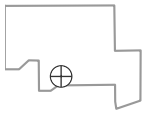


Notes:
1. Top of screen elevation is 3175.57 ft msl.
2. The bottom of screen elevation is 3125.57 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

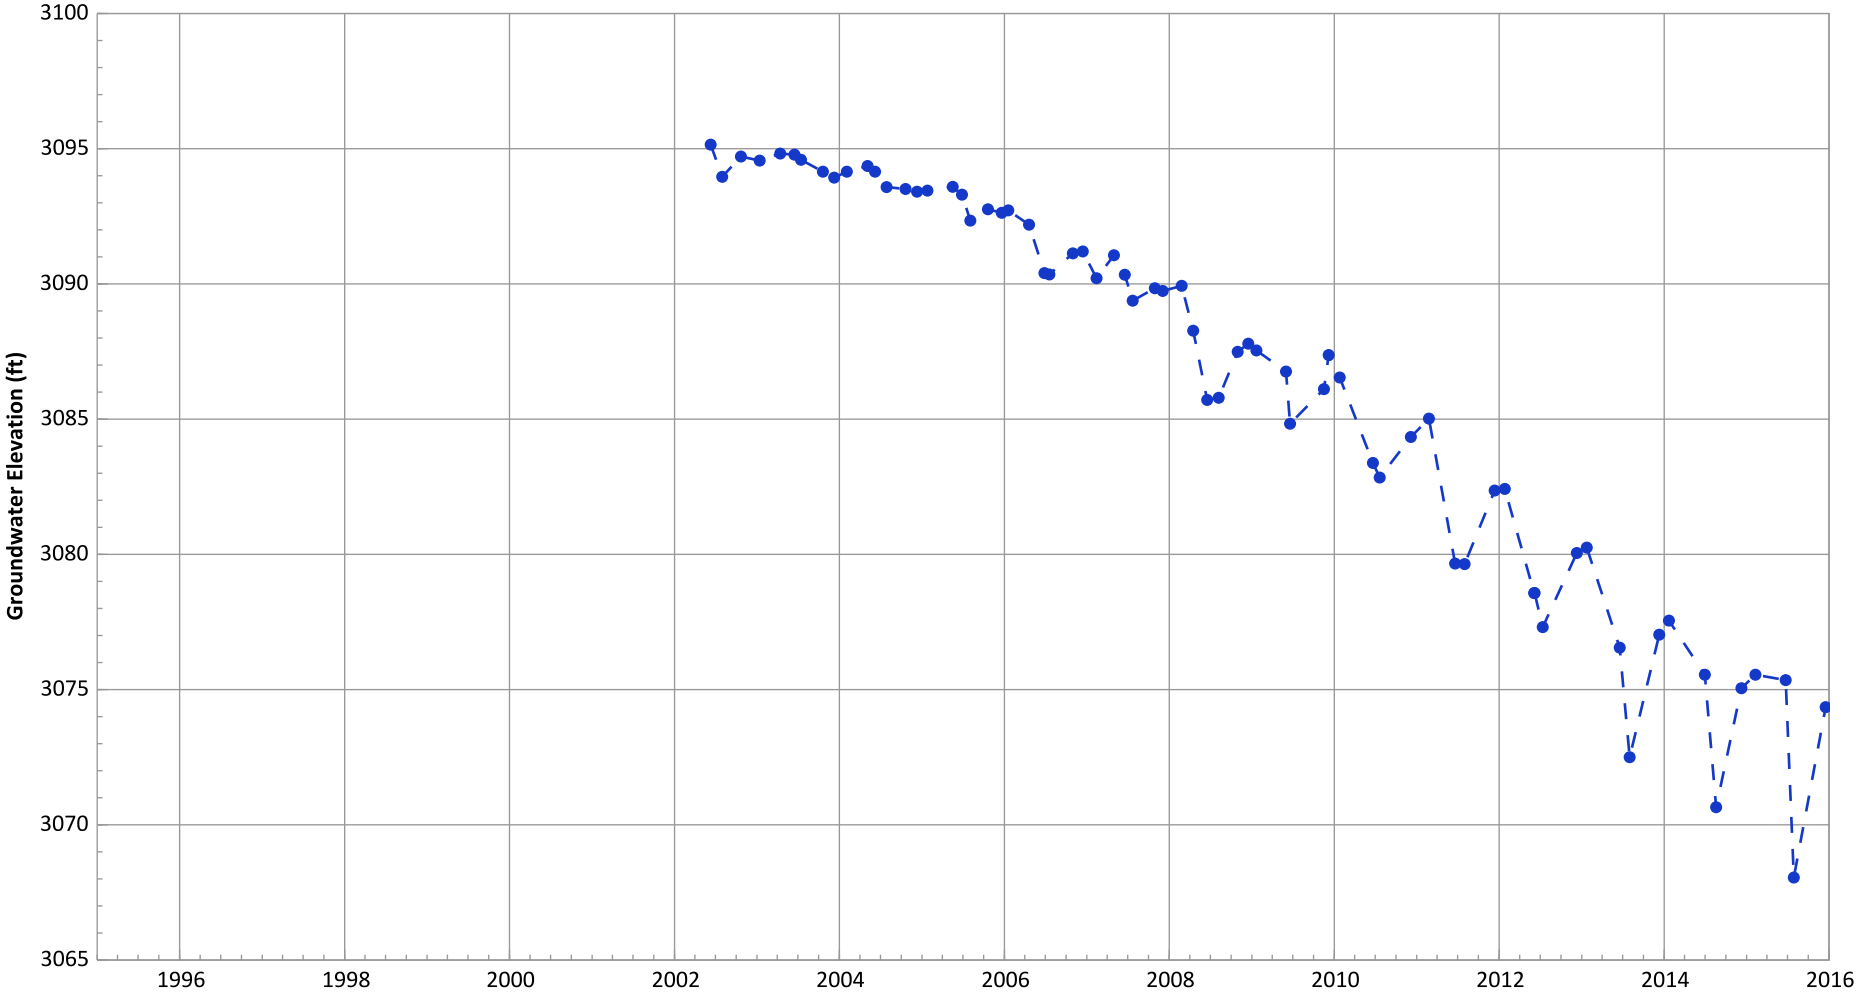
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.59 ft/yr
2013 - 2015 Data: No Trend

PTX01-1010 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

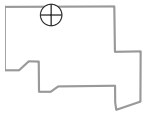


Notes:
1. Top of screen elevation is 3104.01 ft msl.
2. The bottom of screen elevation is 2729.01 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

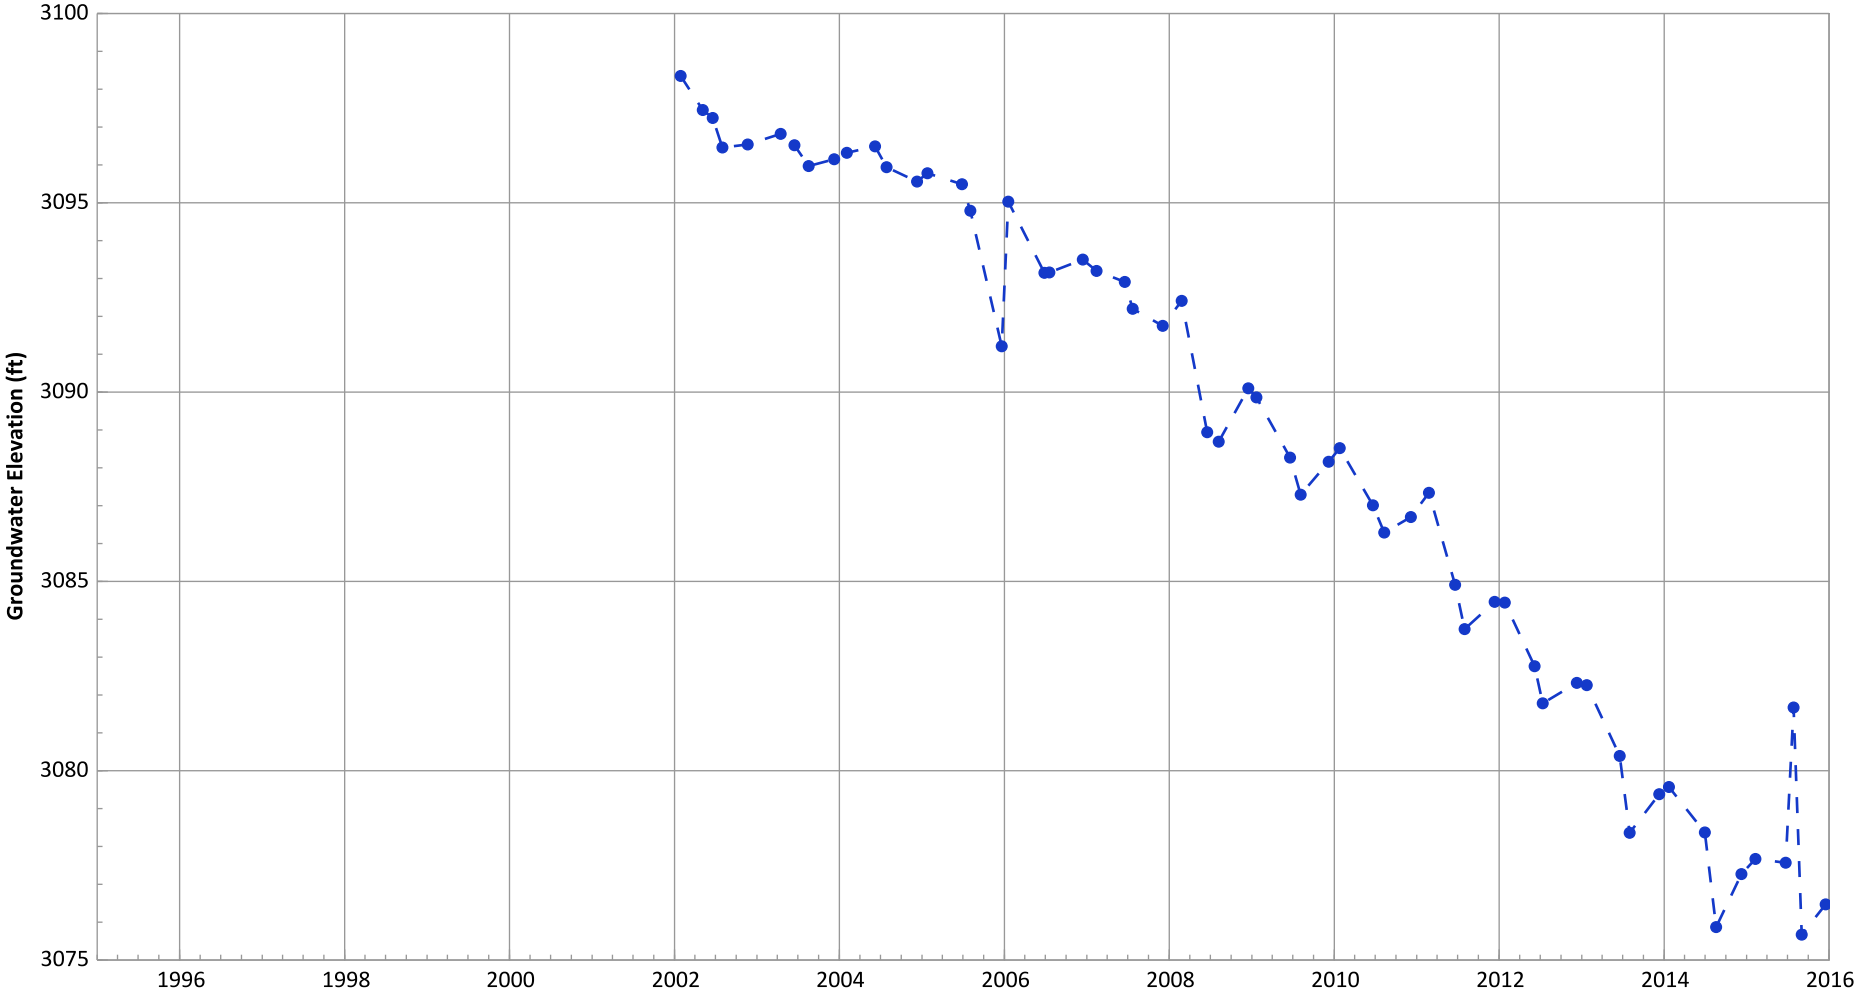
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.81 ft/yr
2013 - 2015 Data: Decreasing at 1.89 ft/yr

PTX01-1011 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

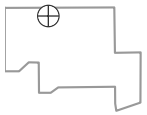


Notes:
1. Top of screen elevation is 3107.81 ft msl.
2. The bottom of screen elevation is 2782.81 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

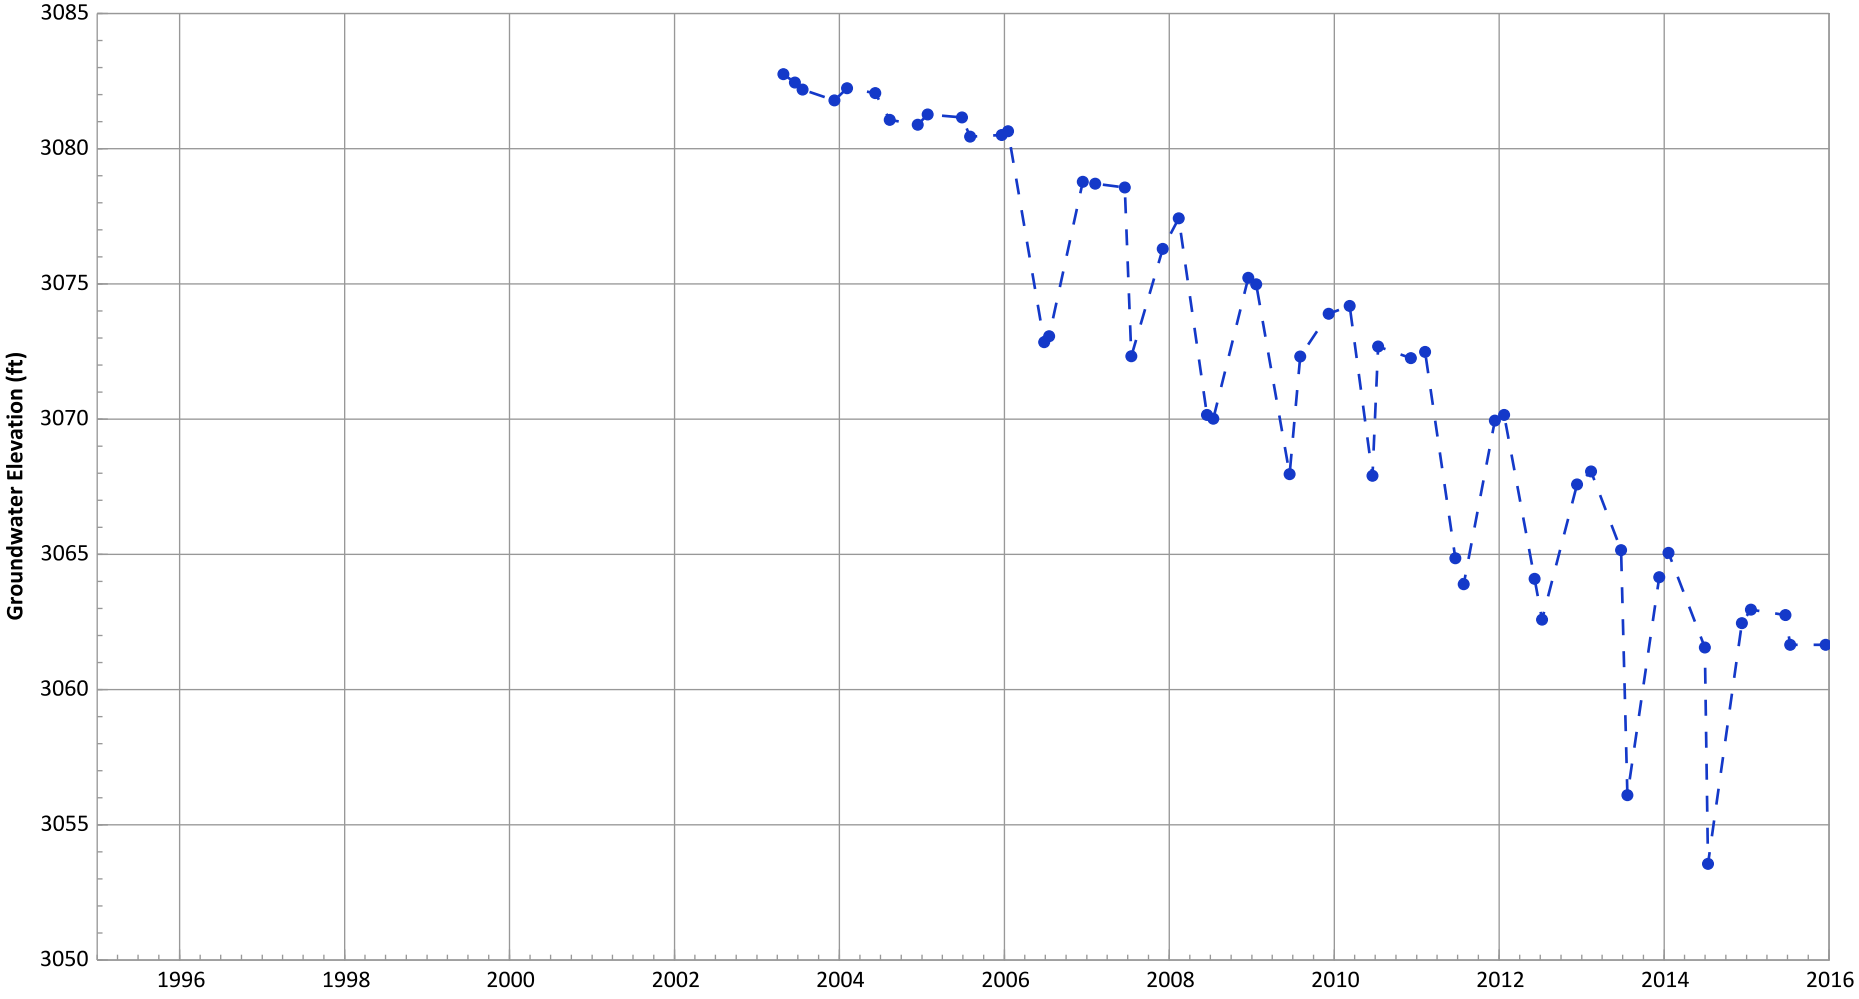
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.62 ft/yr
2013 - 2015 Data: Decreasing at 0.58 ft/yr

PTX01-1012 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

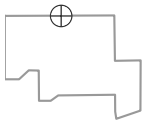


Notes:
1. Top of screen elevation is 3112.48 ft msl.
2. The bottom of screen elevation is 2677.48 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

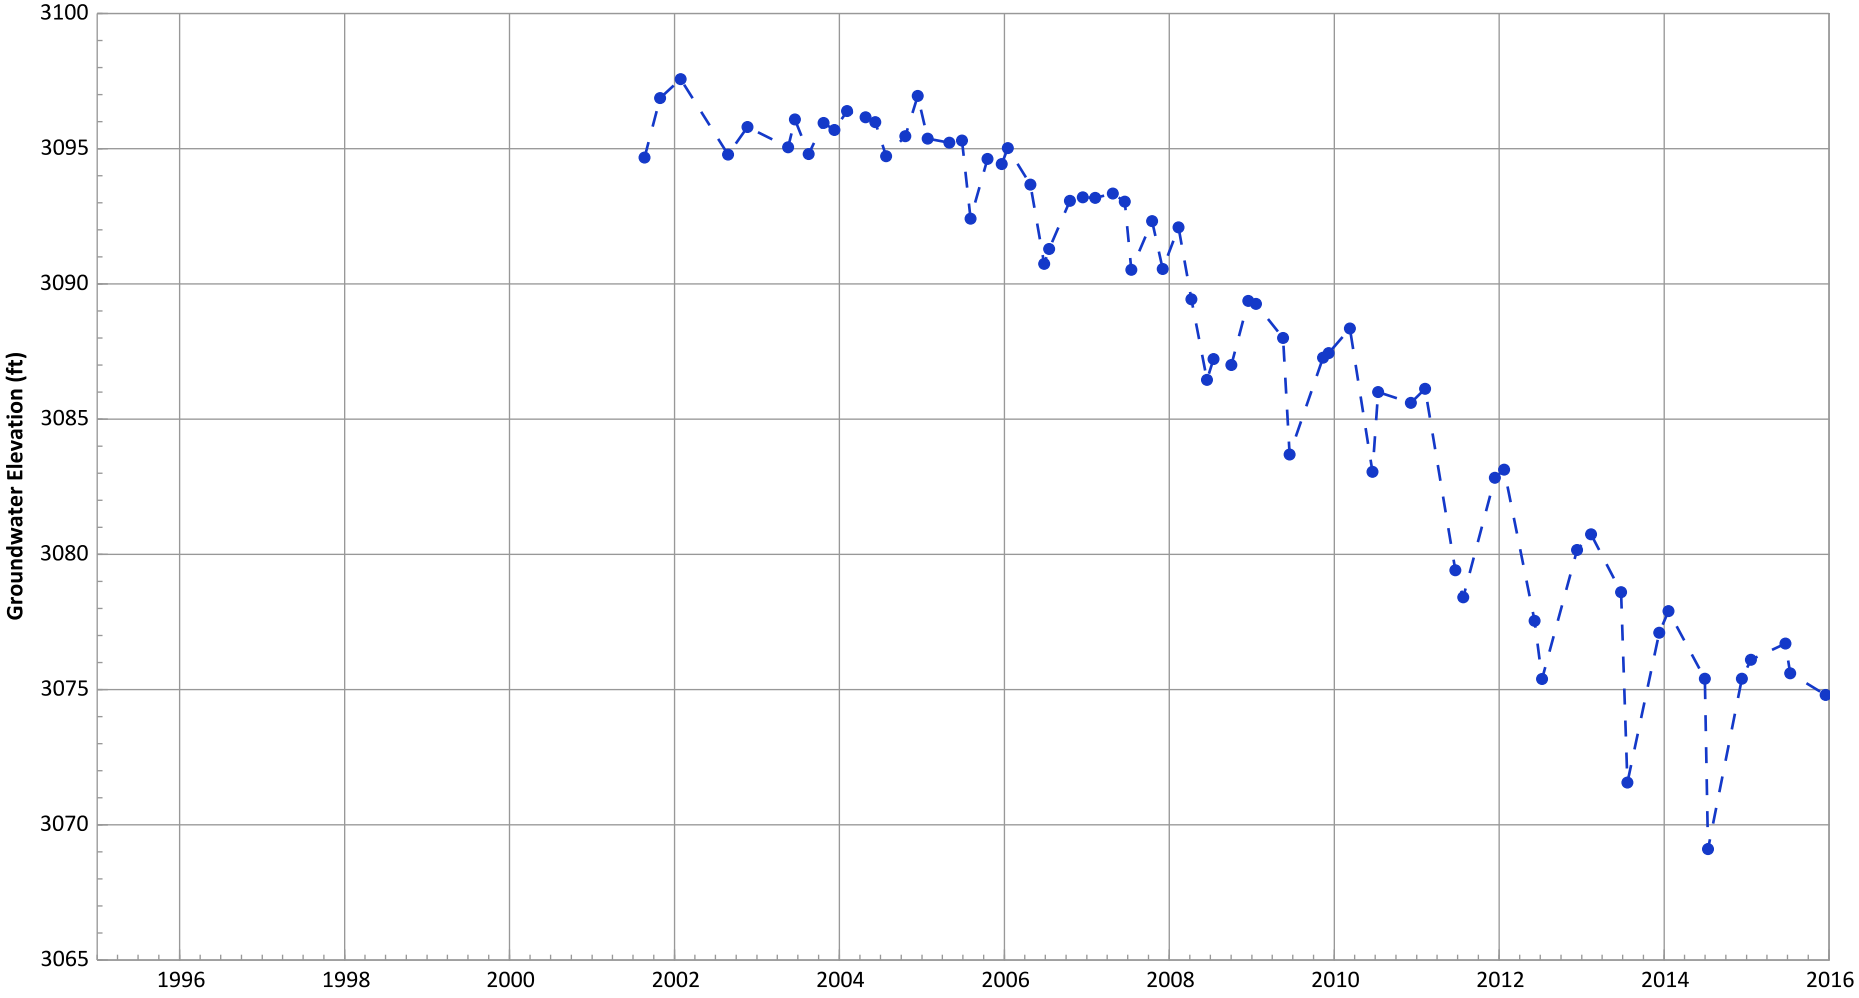
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.9 ft/yr
2013 - 2015 Data: Increasing at 0.42 ft/yr

PTX01-1013 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

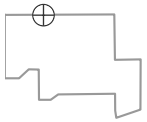


Notes:
1. Top of screen elevation is 3122.17 ft msl.
2. The bottom of screen elevation is 2717.17 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

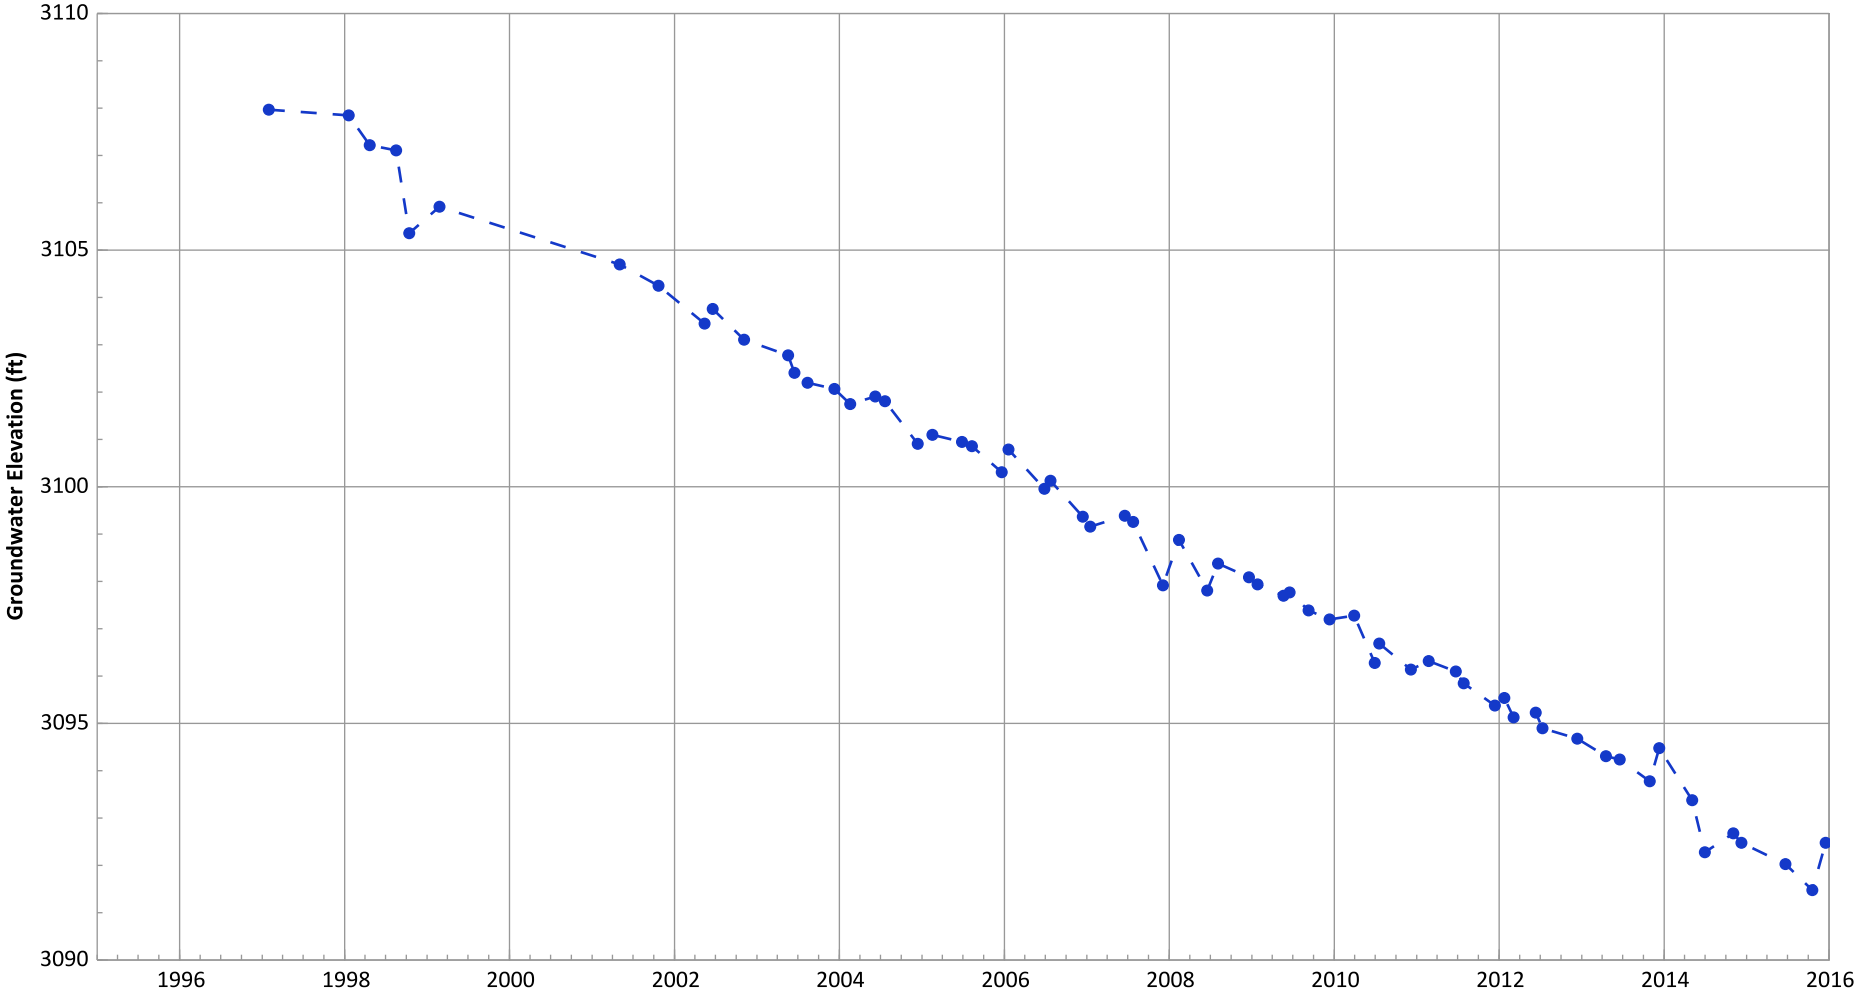
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.85 ft/yr
2013 - 2015 Data: Increasing at 0.27 ft/yr

PTX06-1033 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

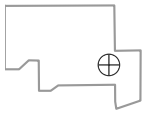


Notes:
1. Top of screen elevation is 3134.04 ft msl.
2. The bottom of screen elevation is 2994.04 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

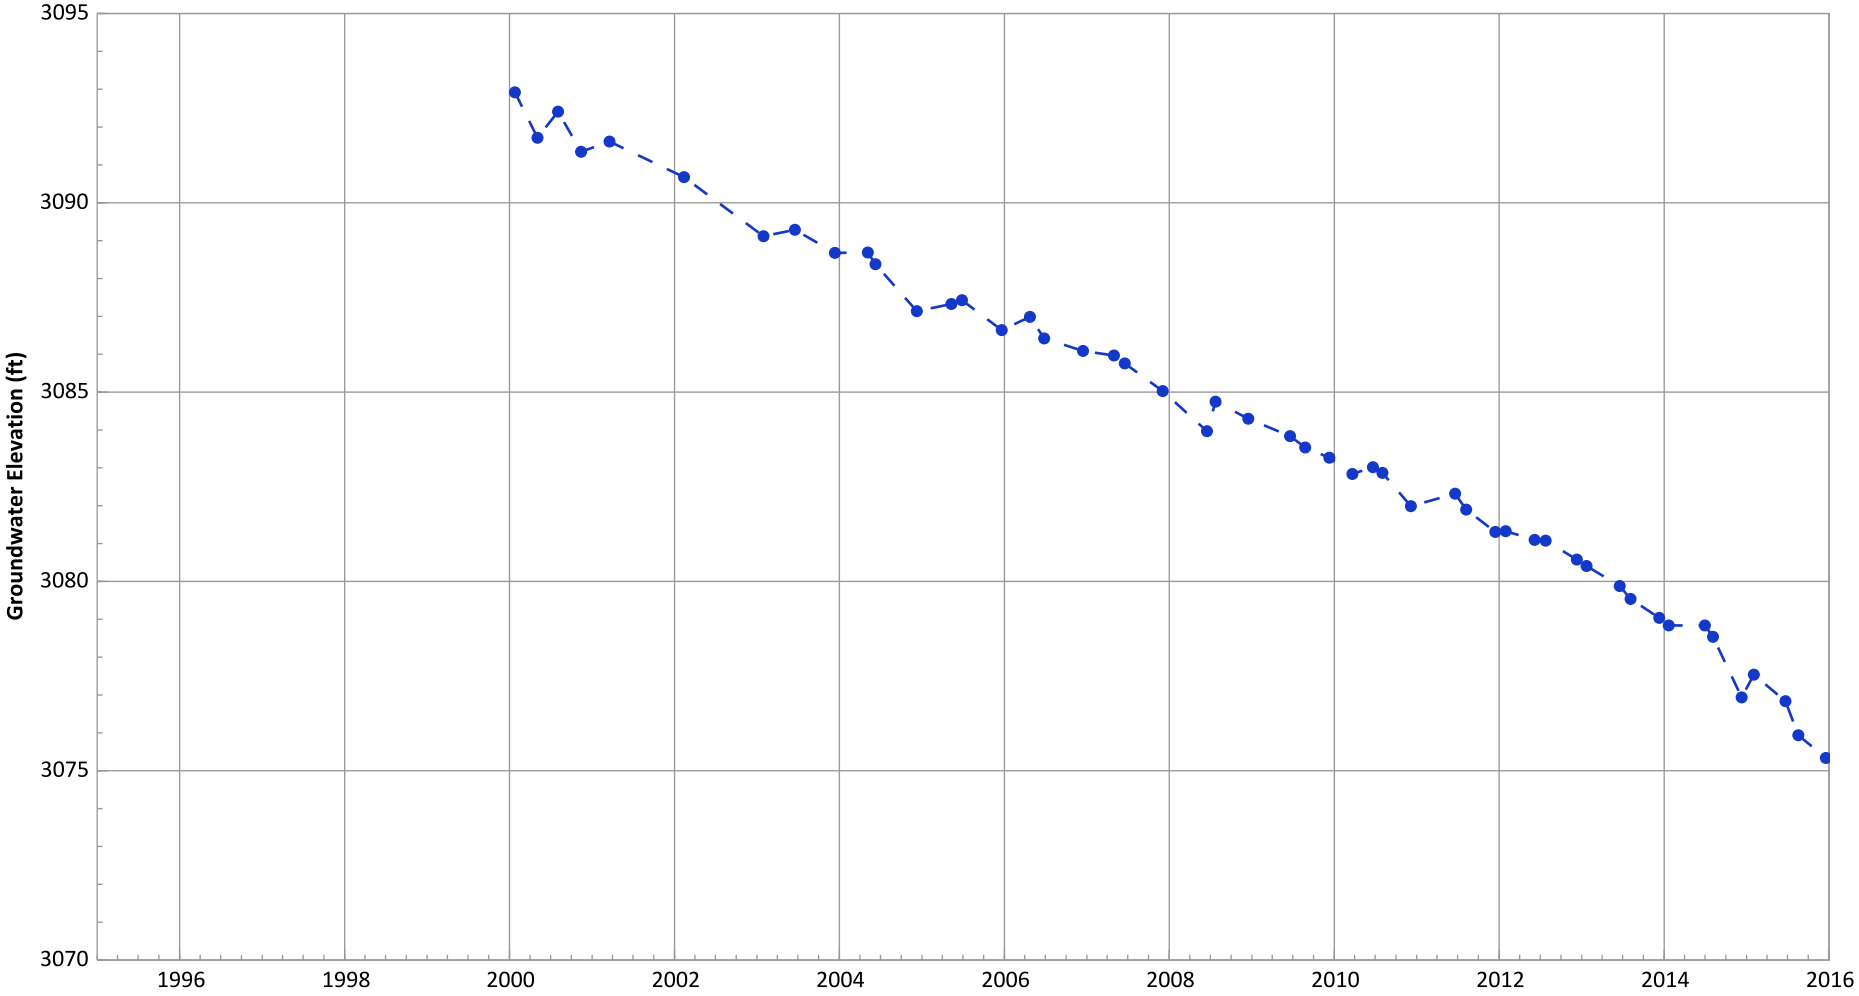
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.85 ft/yr
2013 - 2015 Data: Decreasing at 0.61 ft/yr

PTX06-1043 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

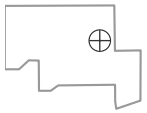


Notes:
1. Top of screen elevation is 3116.09 ft msl.
2. The bottom of screen elevation is 2896.09 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

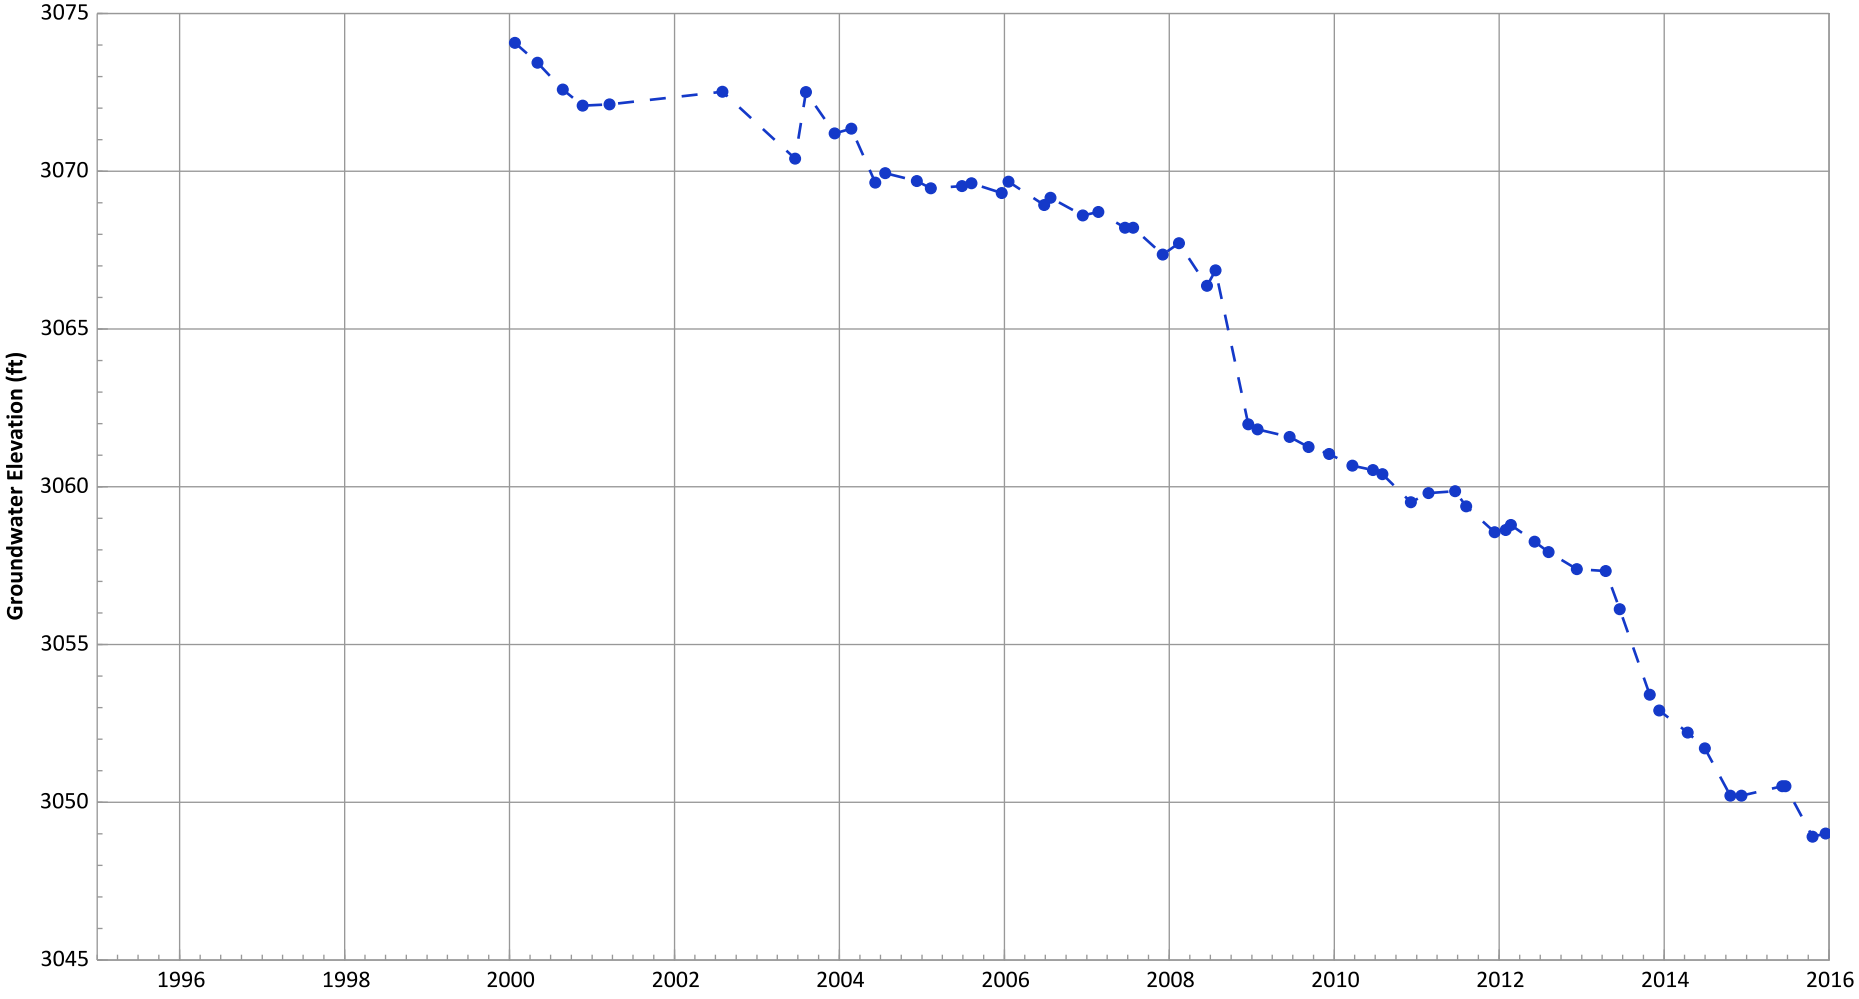
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.98 ft/yr
2013 - 2015 Data: Decreasing at 1.98 ft/yr

PTX06-1044 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant



Notes:
1. Top of screen elevation is 3148.69 ft msl.
2. The bottom of screen elevation is 2928.69 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

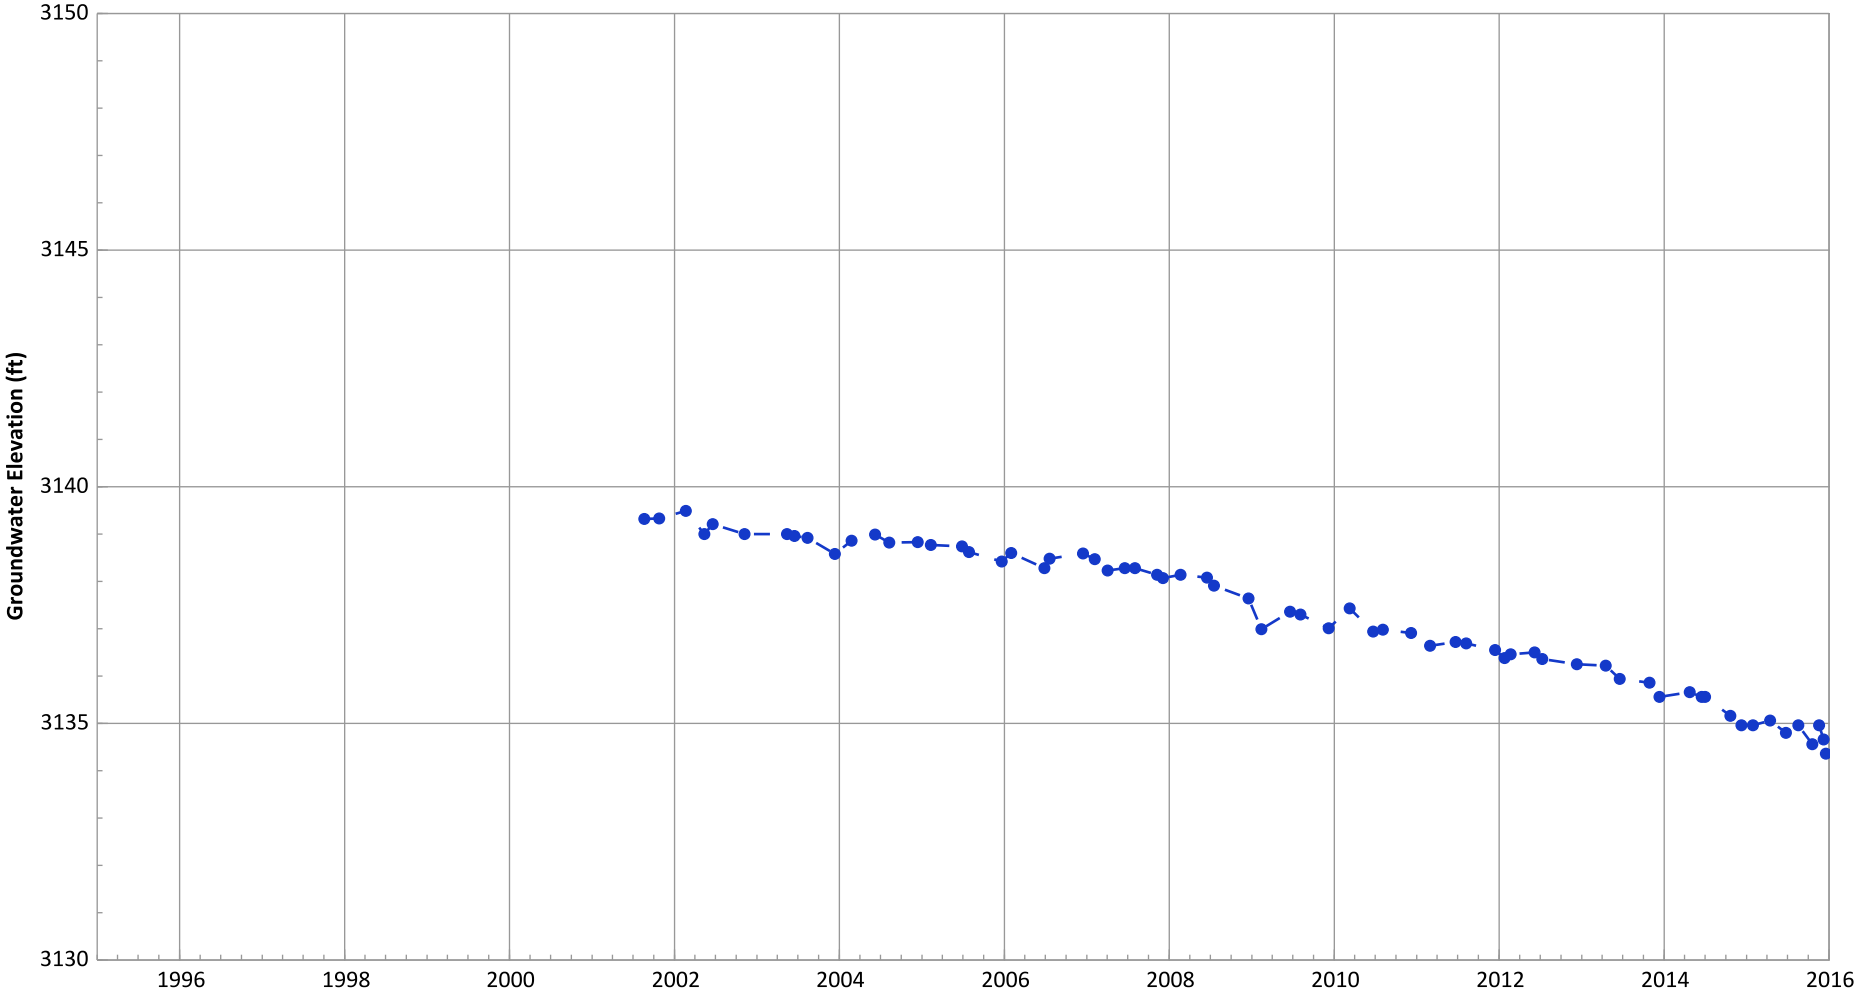
Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.63 ft/yr
2013 - 2015 Data: Decreasing at 1.67 ft/yr

PTX06-1056 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

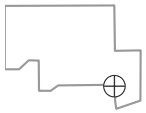


Notes:
1. Top of screen elevation is 3180.77 ft msl.
2. The bottom of screen elevation is 3060.77 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

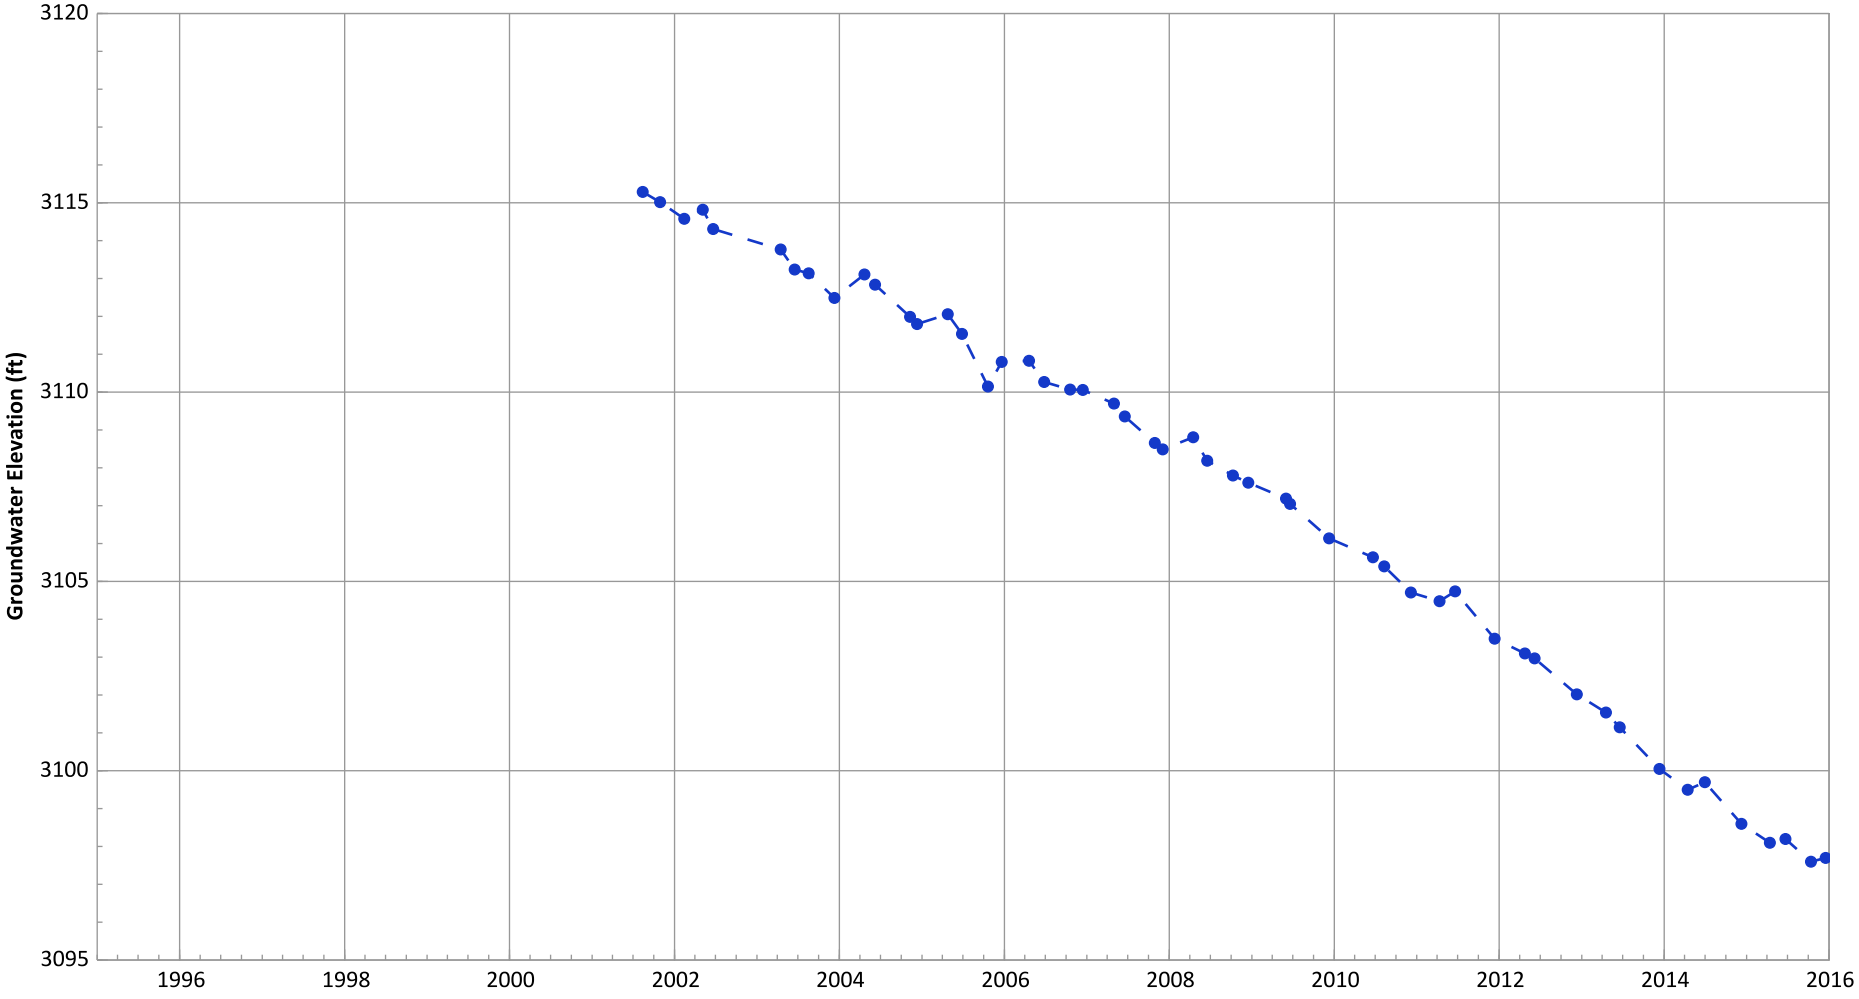
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.34 ft/yr
2013 - 2015 Data: Decreasing at 0.6 ft/yr

PTX06-1057A Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

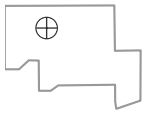


Notes:
1. Top of screen elevation is 3141.52 ft msl.
2. The bottom of screen elevation is 2811.52 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

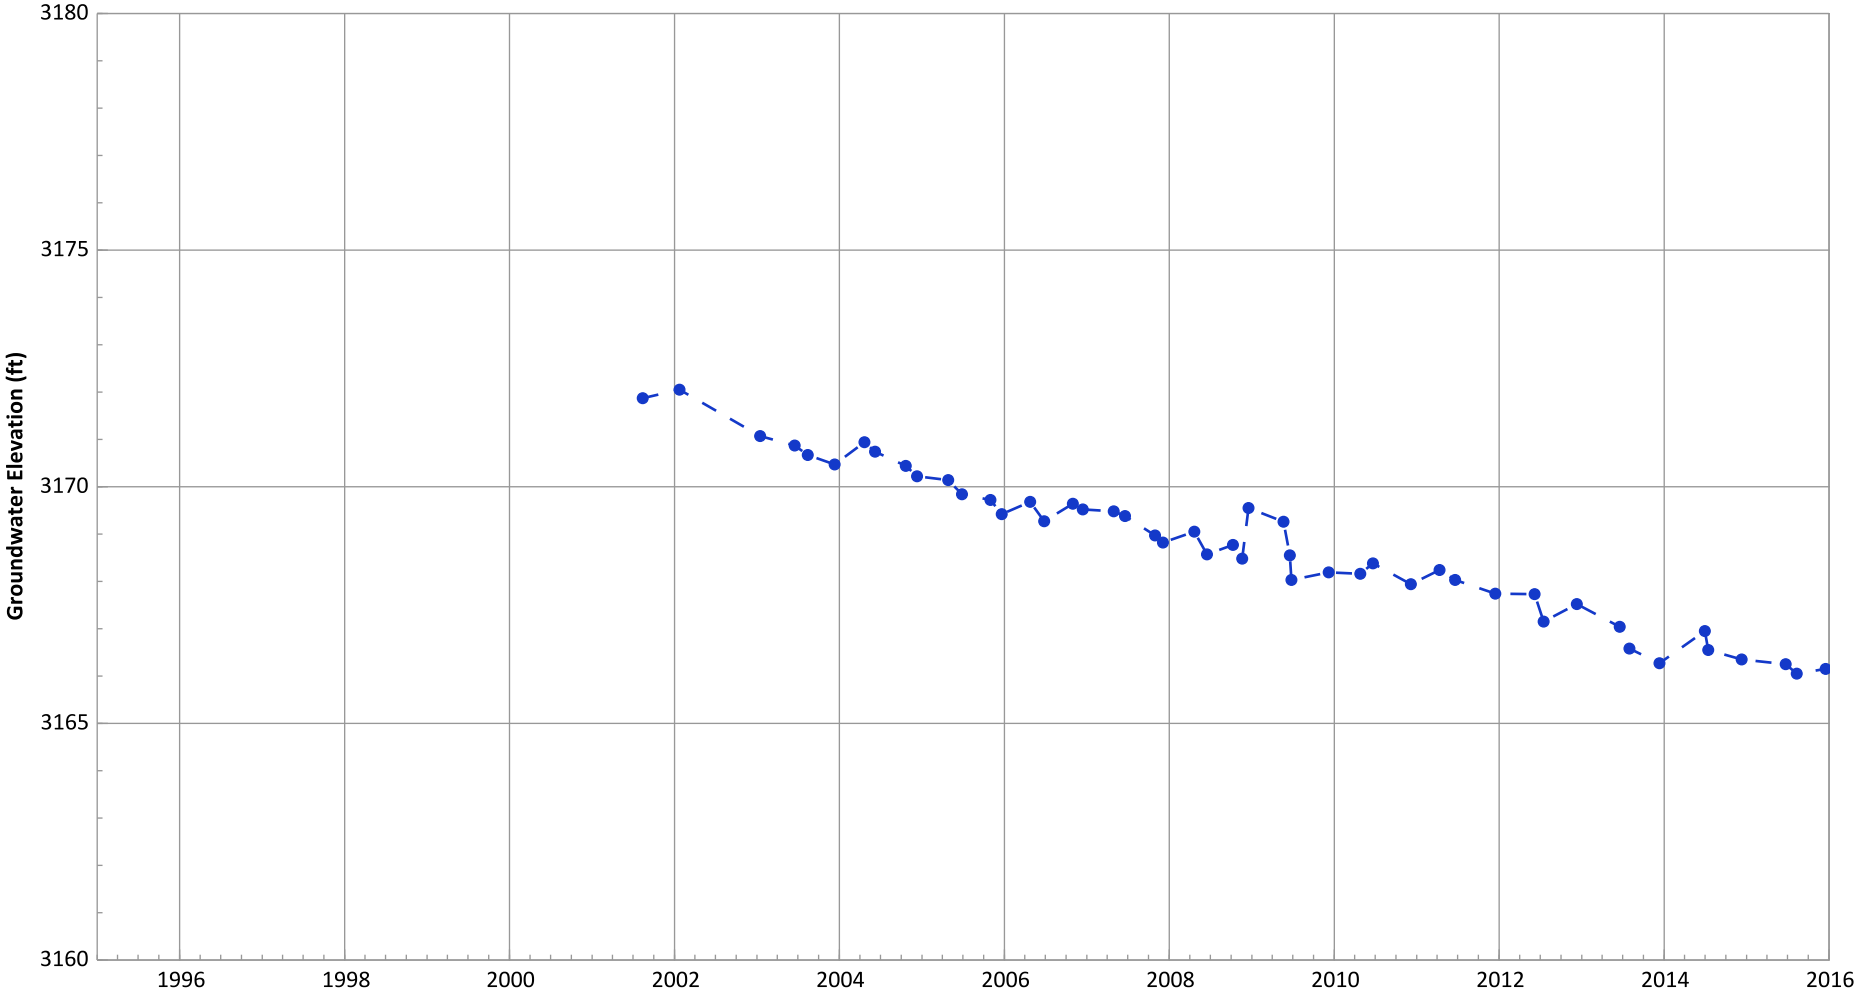
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.25 ft/yr
2013 - 2015 Data: Decreasing at 1.27 ft/yr

PTX06-1058 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

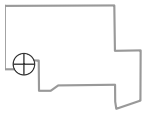


Notes:
1. Top of screen elevation is 3188.45 ft msl.
2. The bottom of screen elevation is 3038.45 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

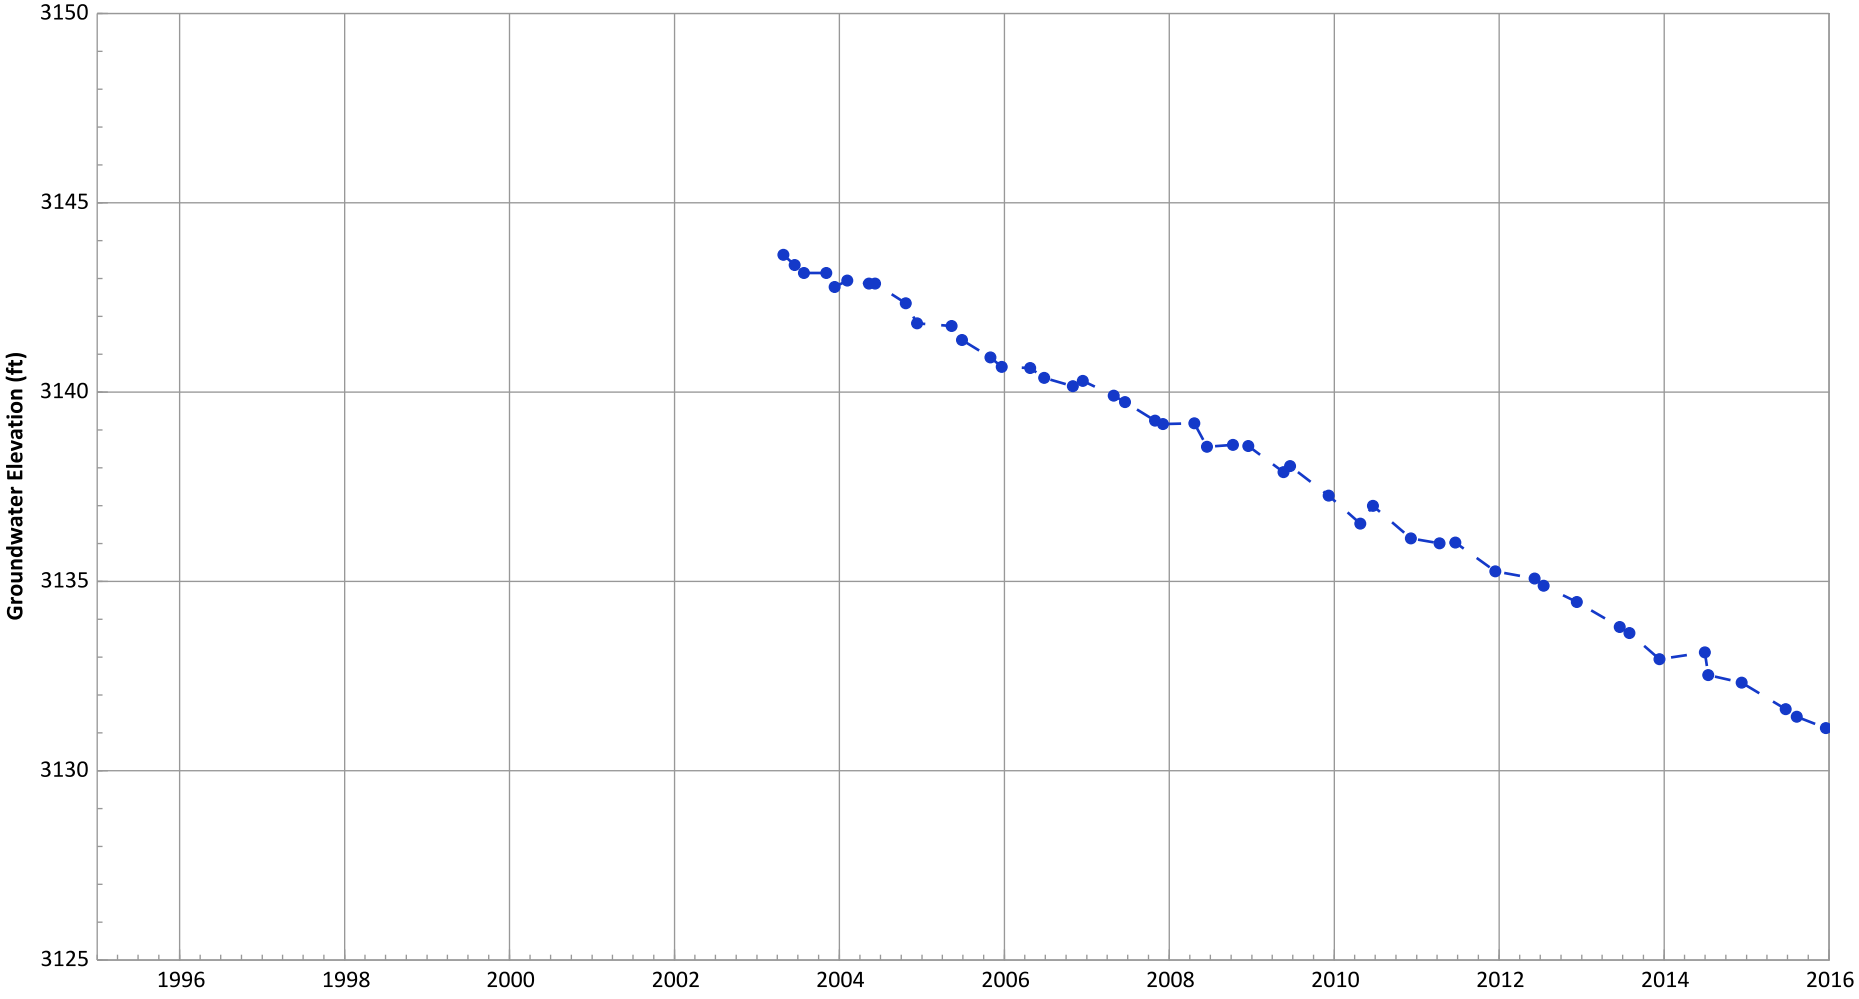
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.39 ft/yr
2013 - 2015 Data: Decreasing at 0.47 ft/yr

PTX06-1059 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

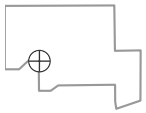


Notes:
1. Top of screen elevation is 3167.39 ft msl.
2. The bottom of screen elevation is 3007.39 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

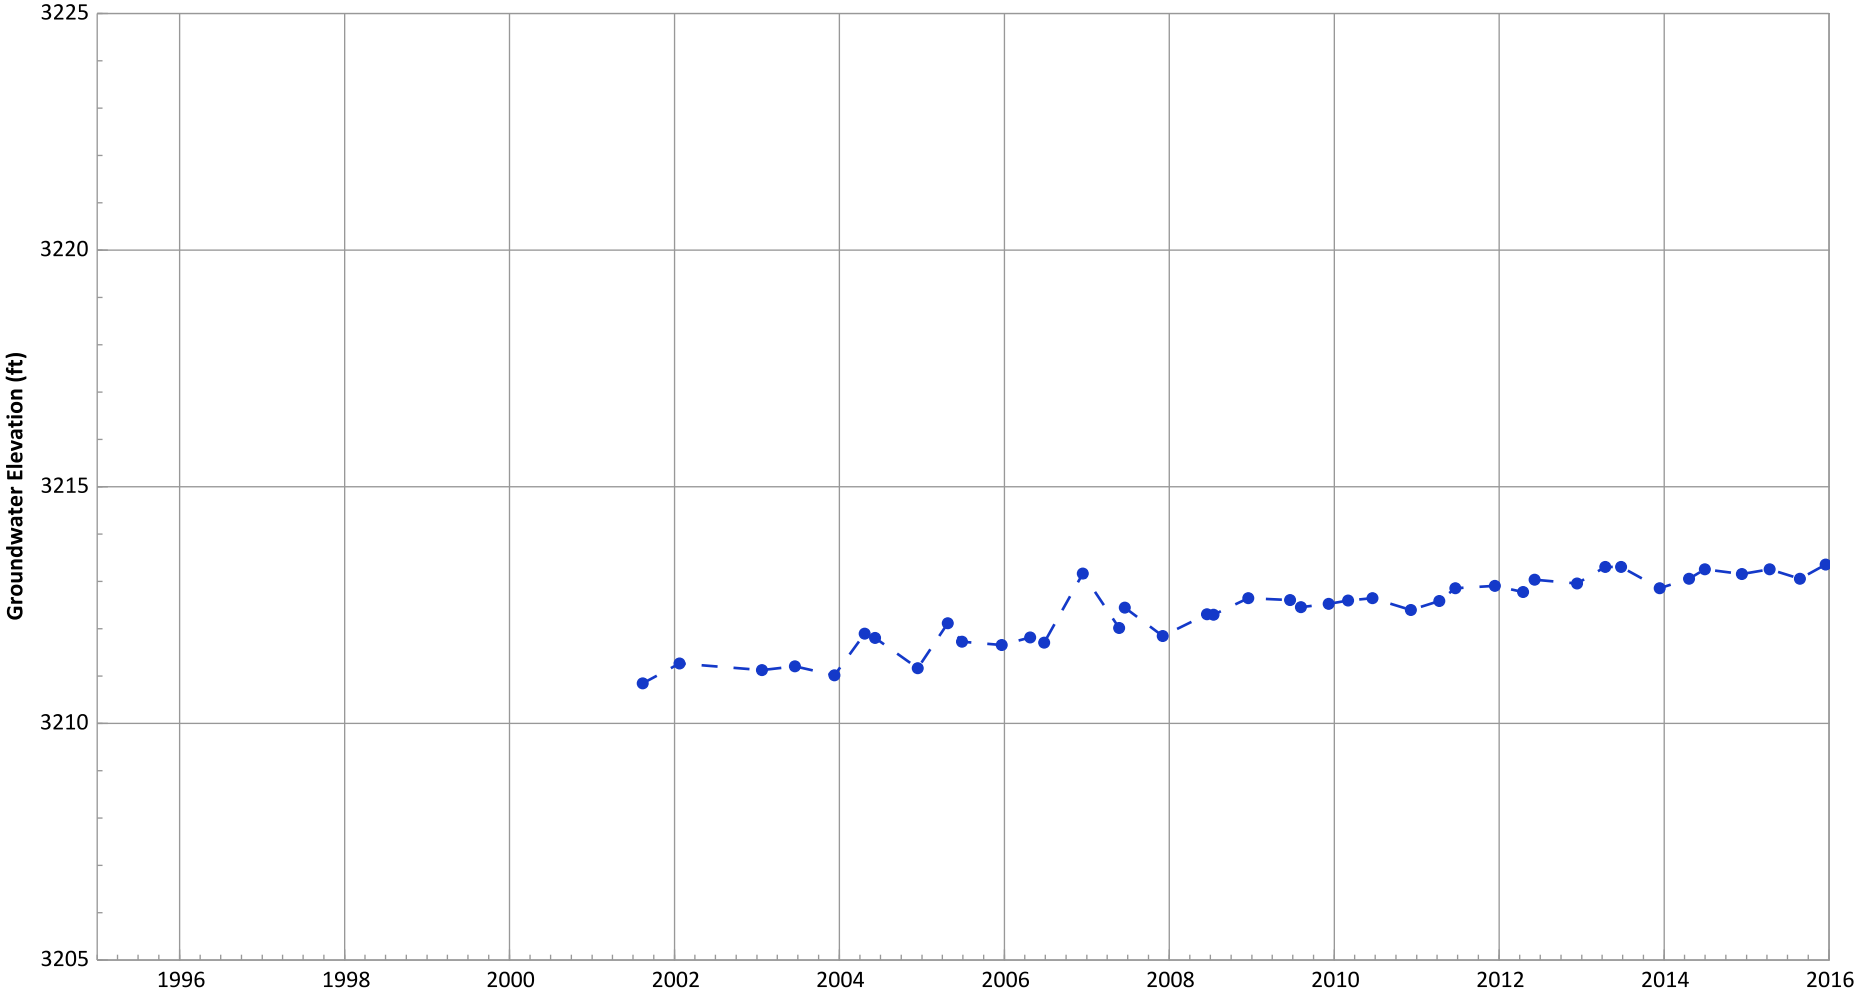
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 0.97 ft/yr
2013 - 2015 Data: Decreasing at 1.22 ft/yr

PTX06-1060 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant



Notes:
1. Top of screen elevation is 3191.81 ft msl.
2. The bottom of screen elevation is 3066.81 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

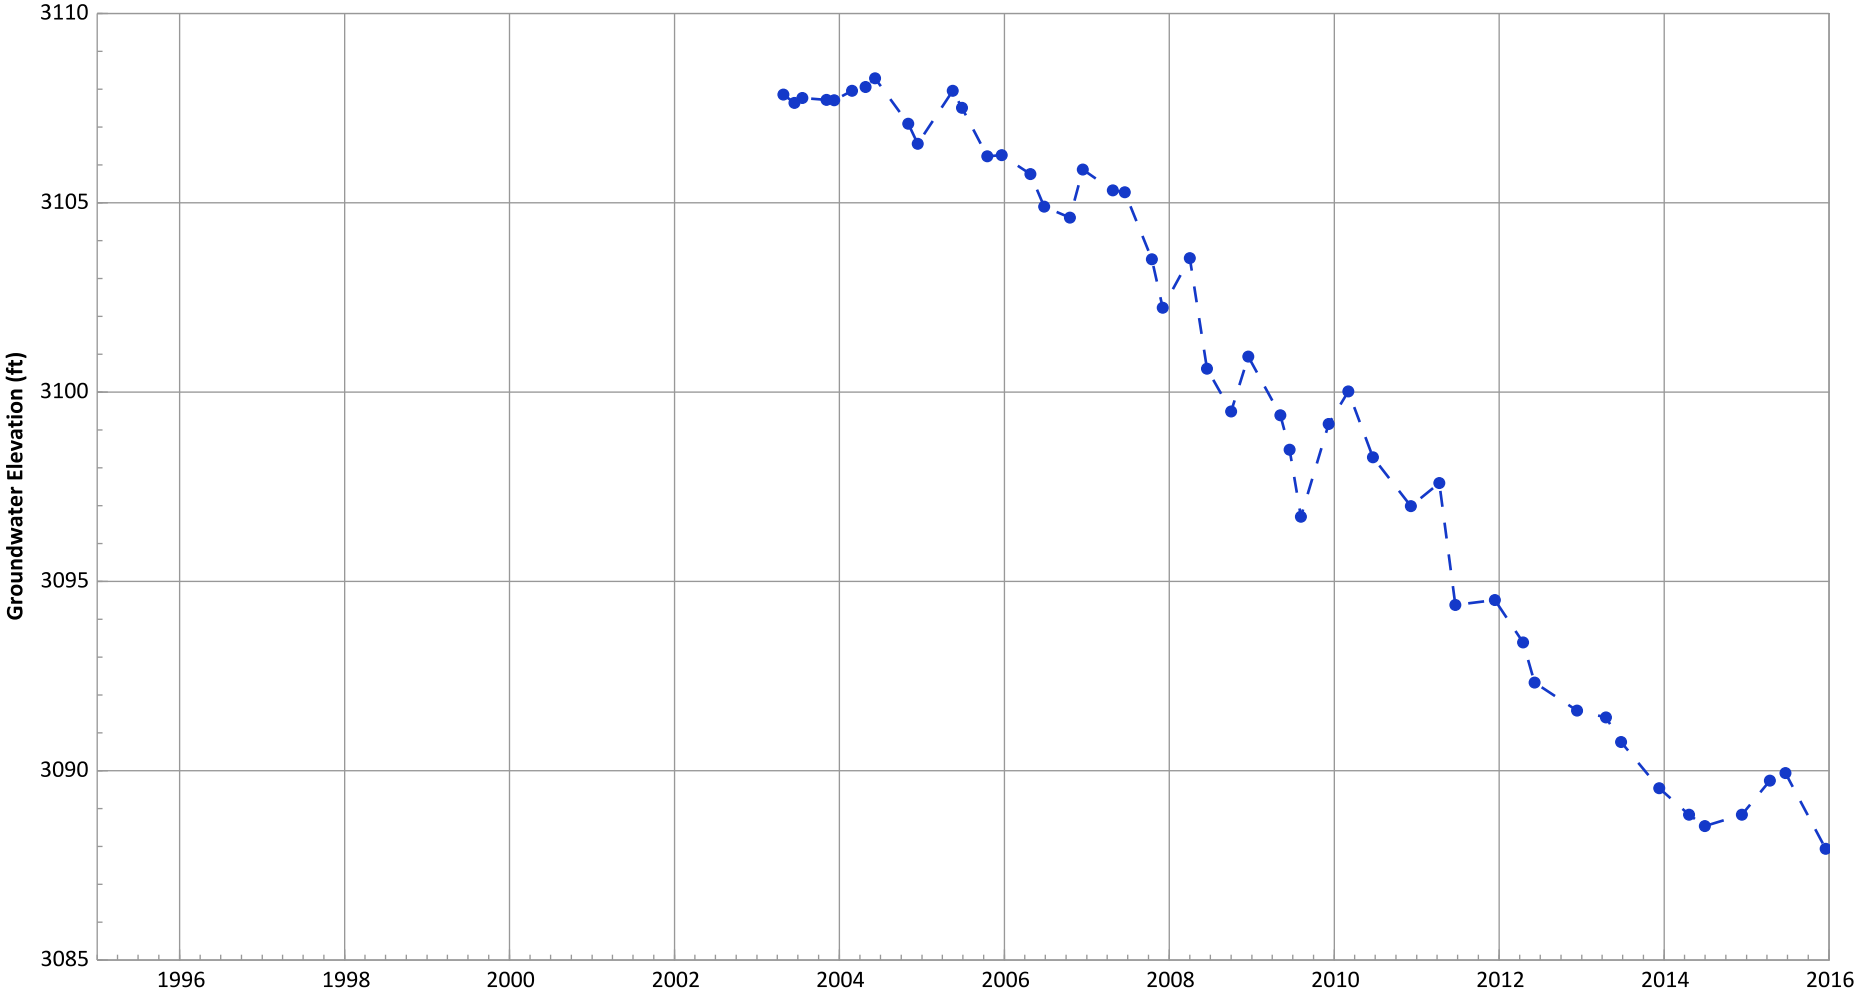
Analysis Date: 05/26/2016

Groundwater Elevation

Well Location

Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Increasing at 0.16 ft/yr
2013 - 2015 Data: No Trend

PTX06-1061 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

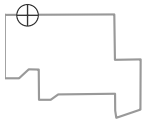


Notes:
1. Top of screen elevation is 3124.65 ft msl.
2. The bottom of screen elevation is 2729.65 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

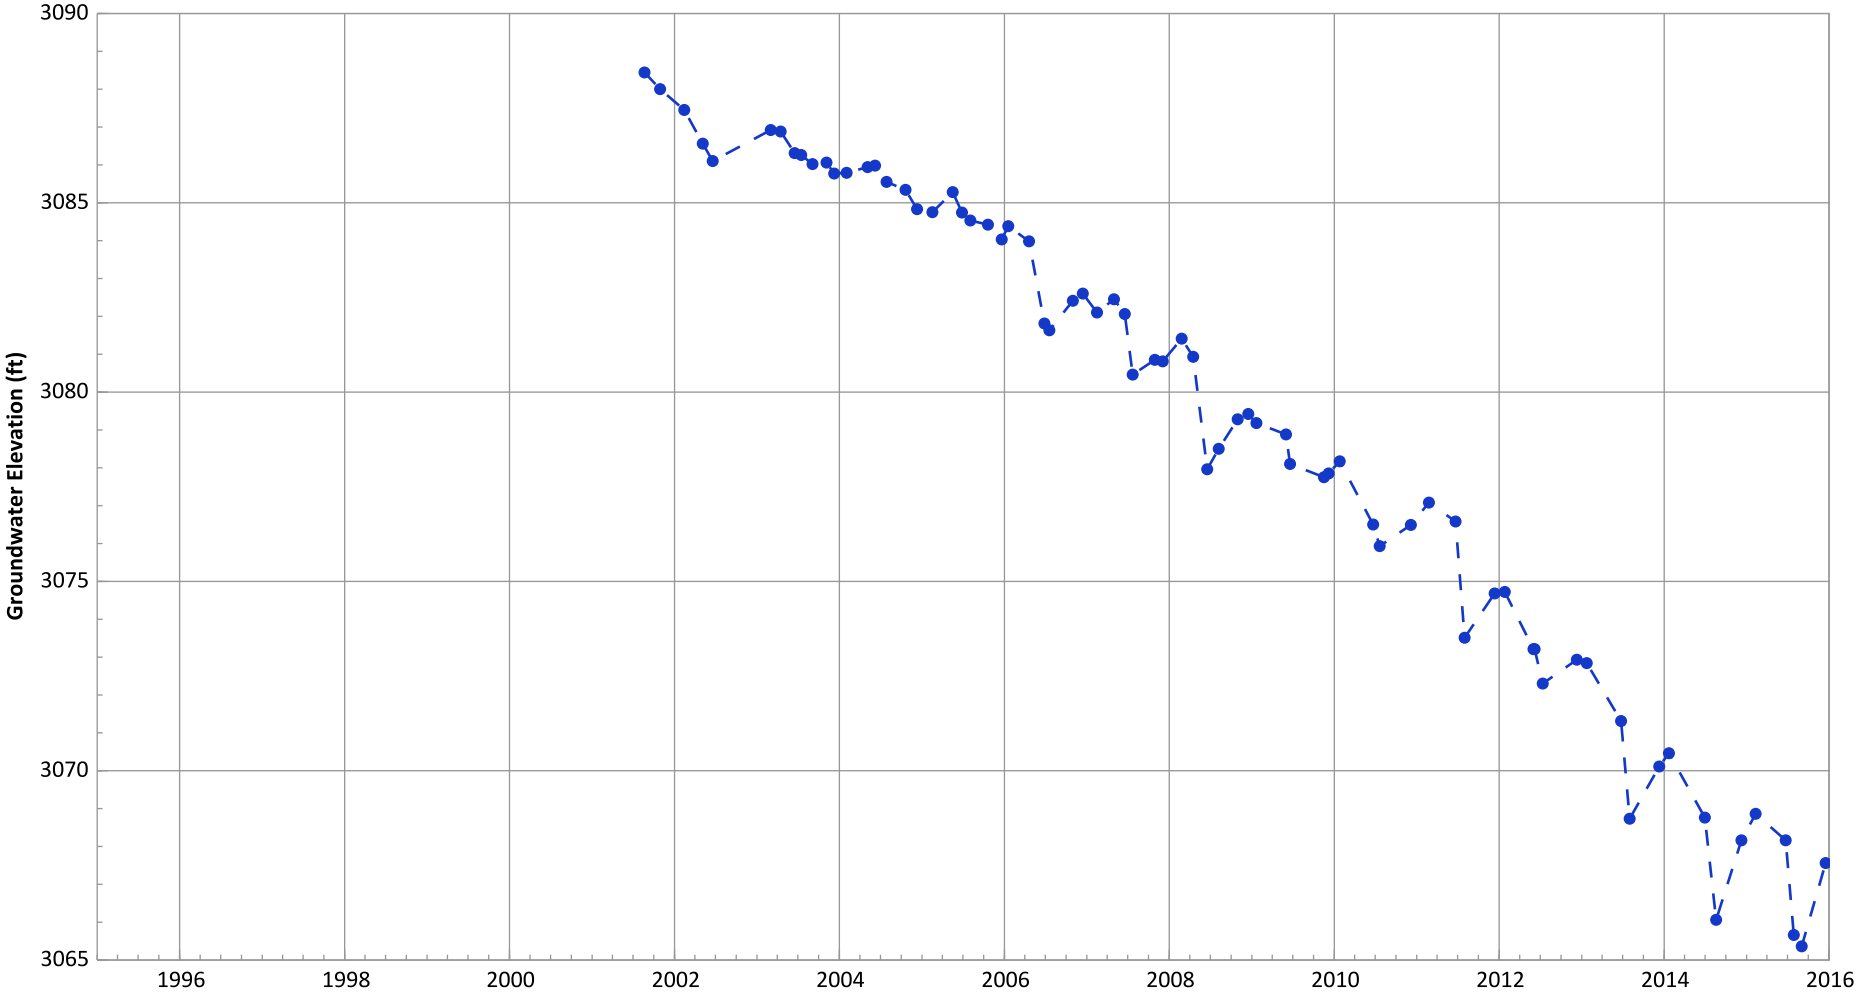
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.79 ft/yr
2013 - 2015 Data: No Trend

PTX06-1062A Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

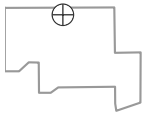


Notes:
1. Top of screen elevation is 3103.89 ft msl.
2. The bottom of screen elevation is 2683.89 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

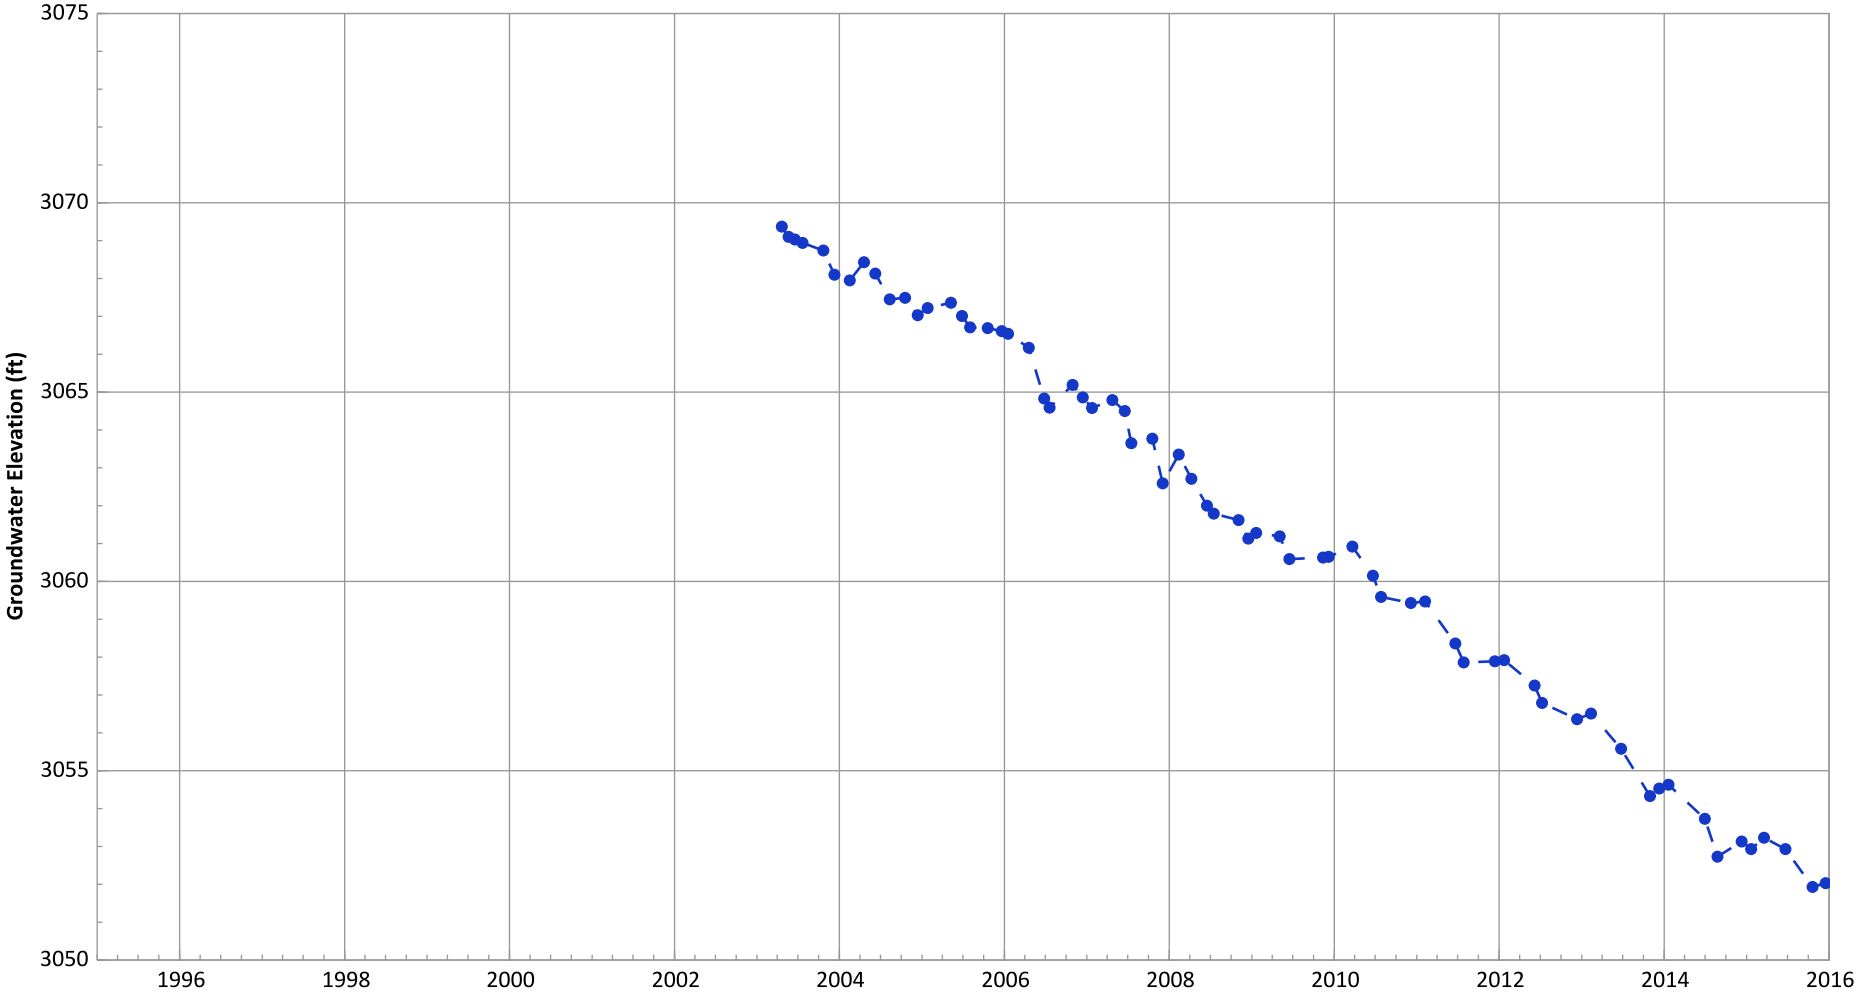
Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)
All Data: Decreasing at 1.57 ft/yr
2013 - 2015 Data: Decreasing at 1.62 ft/yr

PTX06-1064 Hydrograph in Ogallala Aquifer
USDOE/NNSA Pantex Plant

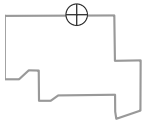


Notes:
1. Top of screen elevation is 3121.99 ft msl.
2. The bottom of screen elevation is 2771.99 ft msl.
3. A continous hydrograph was produced by linear interpolation between successive discrete measurements. Actual groundwater elevations between measurements may be different than shown.

Analysis Date: 05/26/2016

Groundwater Elevation

Well Location



Hydrograph Trend
(MAROS Linear Regression Method)

Appendix G
Well Certifications and Completion Diagrams

U.S. Department of Energy/National Nuclear Security Administration – Pantex Plant
Amarillo, Texas

Certification of Well Construction
Industrial Solid Waste Registration No. 30459
Hazardous Waste Permit No. 50284
EPA Identification No. TX4890110527

Certification Statement:

This is to certify that the replacement and plugging and abandonment of the following facility components authorized or required by Texas Commission On Environmental Quality HW-50284 Provision XI Compliance Plan has been completed, and that construction and plugging and abandonment of said components has been performed in accordance with and in compliance with the design and construction specifications of Provision XI Compliance Plan Attachment C of HW-50284:

- Replacement of Long-Term Monitoring Observation well PTX06-1051
- Plugging and abandonment of original PTX06-1051 monitoring well

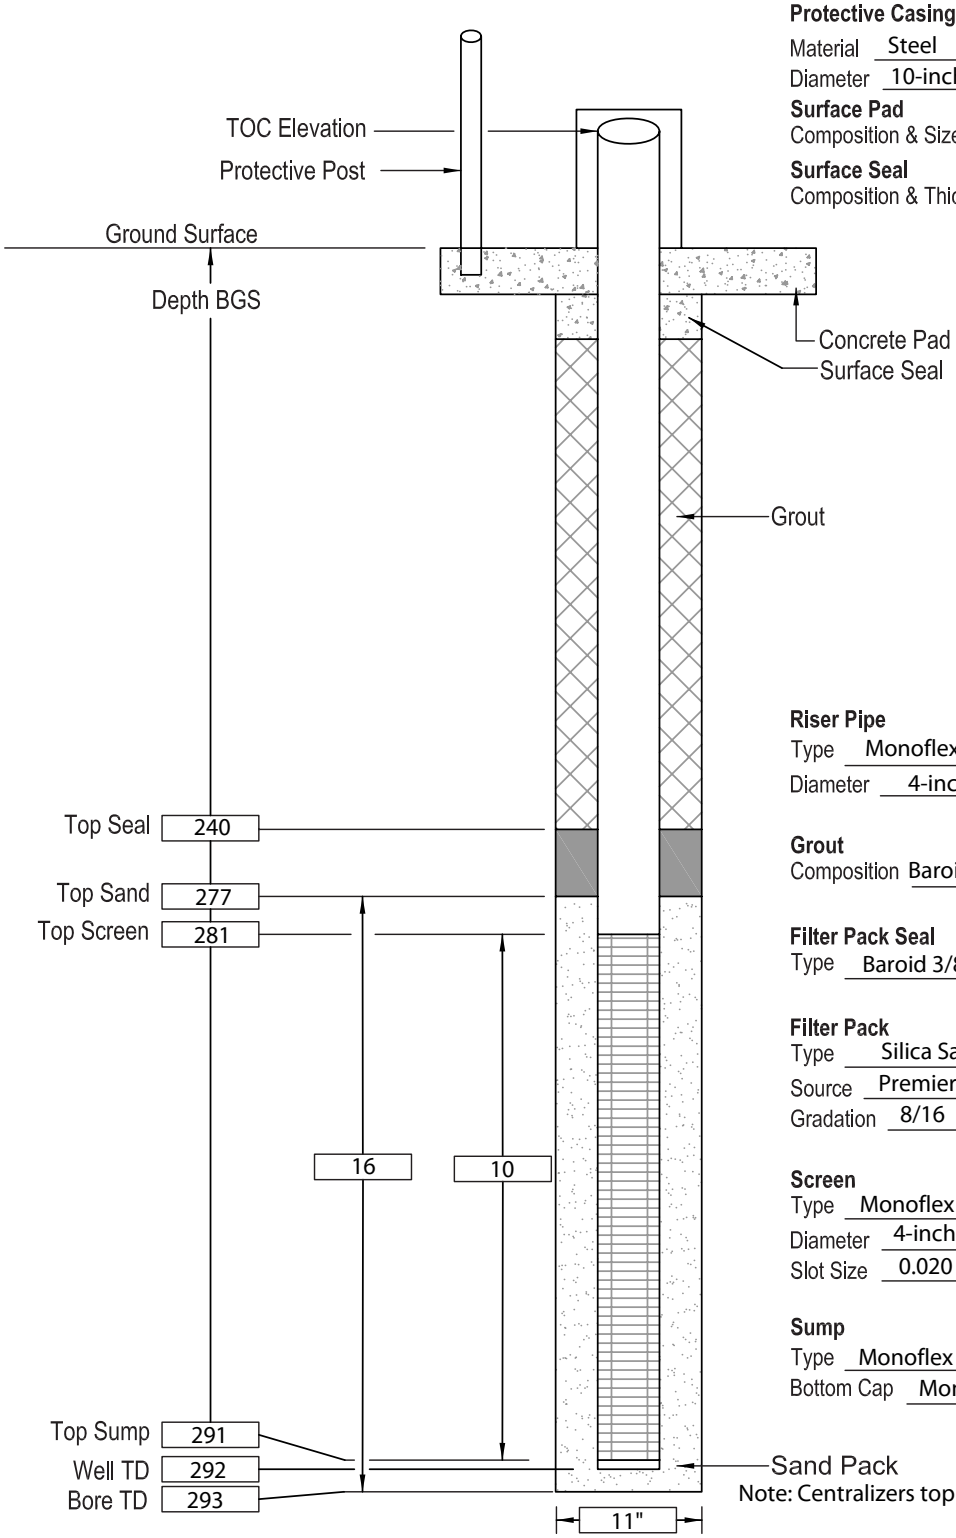
Well Installation Diagram

Project: Pantex BOA 70 Release 1
Location: Texas Tech Property on County Road 8
Contractor: Stoller Newport News Nuclear (SN3)
Driller: National EWP
Well Coordinates: 3752259.66 N 640325.13 E
TOC Elevation: 3532.29 ft amsl
Surface Elevation: 3530.24 ft amsl

Well No: PTX06-1051
Well Type: Groundwater Monitoring
Date Constructed: 10/29/15
Observed By: R Rupp

Sheet 1 of 1



Protective Casing
Material: Steel
Diameter: 10-inches with Royer Locking Cover

Surface Pad
Composition & Size: Concrete, 5' X 5' X 8" thick w/ 4 Bollards

Surface Seal
Composition & Thickness: Concrete, 2 feet poured with the pad

Riser Pipe
Type: Monoflex Schedule 80 PVC
Diameter: 4-inches

Grout
Composition: Baroid Quik-Grout 20% Solids, bentonite, 36 sacks

Filter Pack Seal
Type: Baroid 3/8 Holeplug, bentonite, 30 sacks

Filter Pack
Type: Silica Sand, 14 sacks
Source: Premier Silica, Brady Texas
Gradation: 8/16

Screen
Type: Monoflex Schedule 80 PVC
Diameter: 4-inches
Slot Size: 0.020 (20 slot)

Sump
Type: Monoflex 4'" Schedule 80 PVC
Bottom Cap: Monoflex 4" Schedule 80 PVC

Note: Centralizers top and bottom of screen and every 40' on Casing

Attachment 1: Comparison of 2009 and 2015 Perched Aquifer Groundwater Elevations

II. Introduction

This updated evaluation is included in the 2015 Annual Progress Report as a result of key findings in the First Five-Year Review Report (Pantex 2013). The report recognized that perched groundwater COC plumes continue to move and/or expand downgradient, especially to the east of FM 2373 and in the southeastern lobe of the perched aquifer. As stated in the Groundwater Remedy Effectiveness Evaluation (Trihydro 2012) conducted as part of the First Five-Year Review, portions of these areas are not under the short-term influence of the SEPTS and may not be under the long-term influence because of limited saturated thickness or other limiting hydrogeologic conditions (see Figure 1).

Because of the issues identified, Pantex is evaluating these areas in more detail than prior reporting efforts, which tended to focus more on the operation of installed remedial actions and effects on the perched groundwater system as a whole rather than these areas near the fringe of perched groundwater that may or may not be influenced by the installed remedial actions. This report is the fourth focusing on these areas, and will be updated and revised yearly as part of the Annual Progress Reporting as additional data is collected and analyzed.

The 2015 update includes discussion of water level and COC concentration data along with a discussion of the aquifer testing data collected in 2015.

Even though several high explosive compounds are found in this region, this report focuses on the RDX plume because it is the most widespread COC occurring at the highest concentrations in these areas and has been consistently used in prior reporting and evaluations to represent the southeast plume. The following sections discuss RDX concentrations, trends, and apparent plume movement in perched groundwater east of FM 2373, along with the effects of pump and treat operations over time.

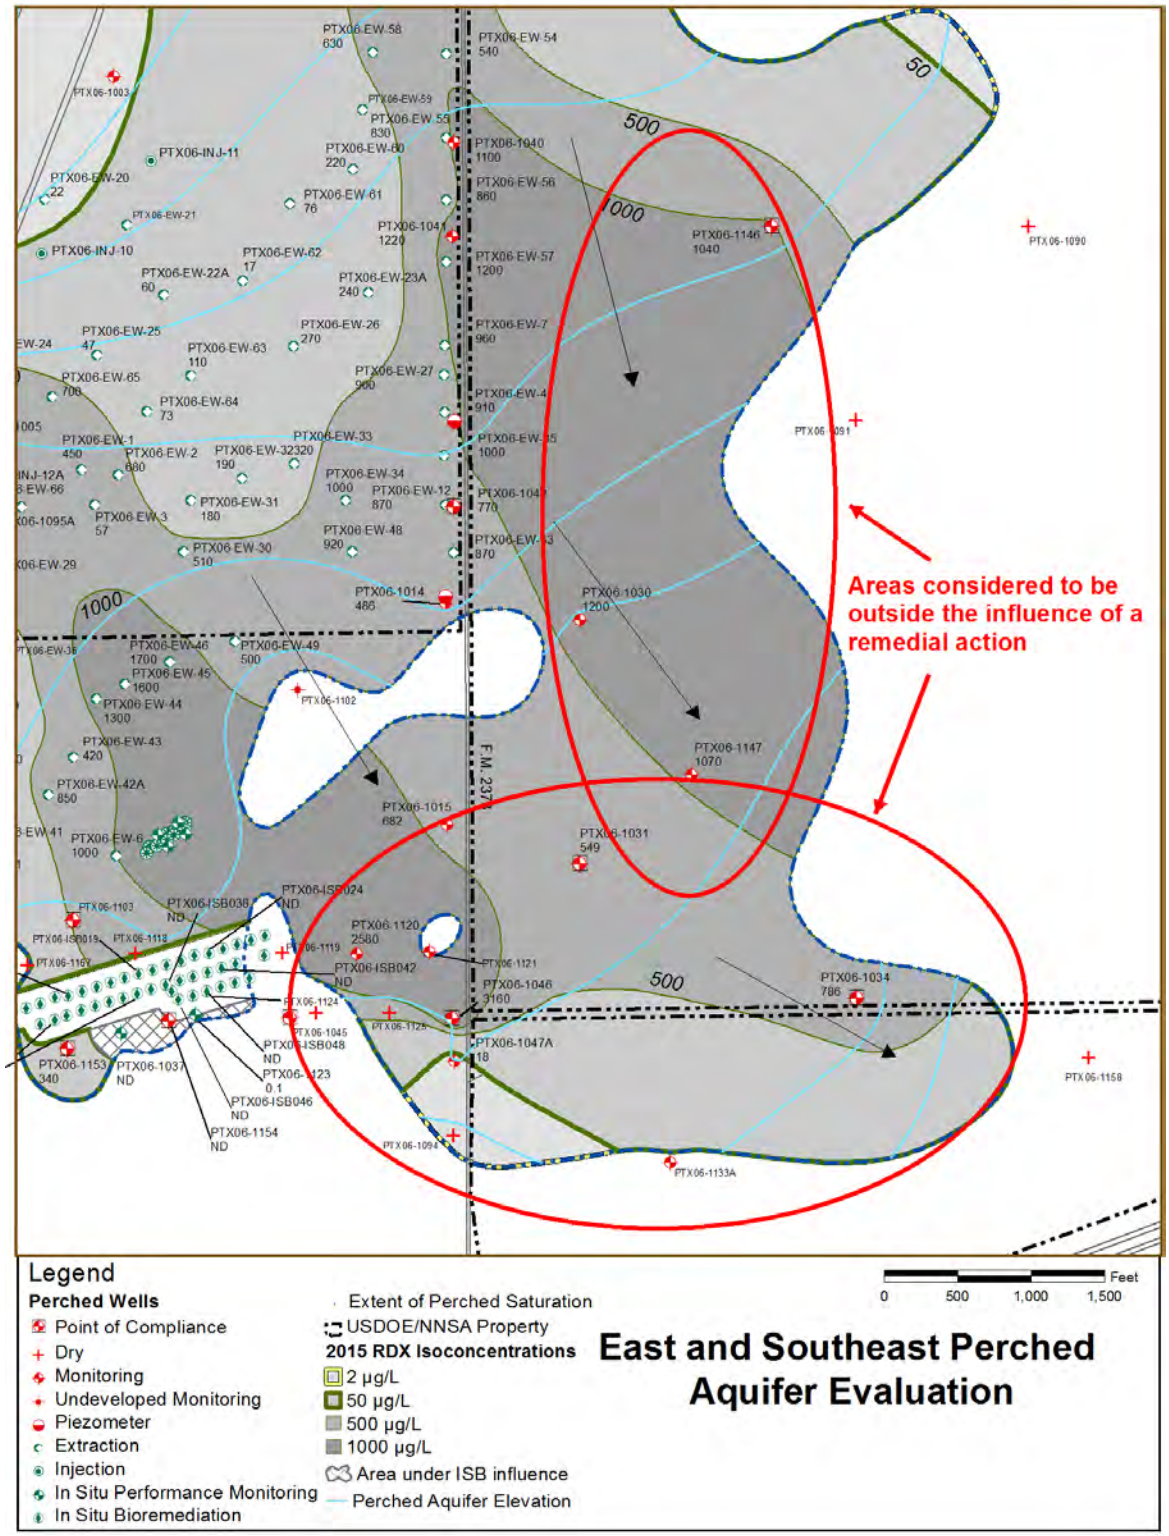

Figure 1. Areas of Perched Groundwater outside the Influence of Remedial Actions

III. Wells Evaluated

Many wells have been installed in the areas identified as currently outside the influence of a remedial action depicted in Figure 1. These wells are discussed in detail below and include:

- PTX06-1015
- PTX06-1030
- PTX06-1031
- PTX06-1034
- PTX06-1046
- PTX06-1047A
- PTX06-1120
- PTX06-1121
- PTX06-1146
- PTX06-1147
- PTX06-1133A

Additionally, six dry wells are installed in this region of perched groundwater and help define the perched extent. These wells are monitored at least twice per year for water levels and will be included in this evaluation if water is observed in these wells. These dry wells include:

- PTX06-1158
- PTX06-1094
- PTX06-1125
- PTX06-1124
- PTX06-1090
- PTX06-1091

PTX06-1015 was installed in 1995 on Texas Tech property approximately 150 feet west of FM 2373. RDX concentrations in this well have exceed GWPS since installation. This well is the closest downgradient to the SEPTS extraction well field so it may be the first well to realize effects of extraction. However, an apparently expanding area of very thin perched saturation separates this well from the primary area affected by the SEPTS extraction well field.

PTX06-1030 and PTX06-1031 were installed in 1996 approximately 750 feet east of FM 2373 on the former Cockrell property, which was eventually purchased by DOE in 2008. RDX concentrations in PTX06-1030 have exceeded GWPS since monitoring began in 1996, typically ranging from 500 – 2,000 ug/L. However, a decreasing trend in RDX is indicated by the data collected since the start of remedial actions in 2009. PTX06-1031, which was installed approximately 1,700 feet south of PTX06-1030, had non-detect RDX results in 1996 followed by a gradual increasing trend in RDX. Although the statistical evaluations report an increasing trend, recent concentrations (since 2012) have ranged from approximately 450 to 550 ug/L and appear to be stable within this range.

PTX06-1034 was installed 1998 in the southeast lobe of perched groundwater (former Cockrell property) and is currently the furthest downgradient sampled well installed in the area. RDX was initially non-detect in this well, but concentrations began to dramatically increase in 2005. The RDX concentration increased to the all-time high value of 929 ug/L during the second sampling event of 2014. Measured RDX concentrations in 2015 were slightly lower near 780 ug/L. Because of the concern over increasing COC trends in this well, Pantex installed an additional well (PTX06-1158) further east of PTX06-1034 in 2012, but the well has been dry since installation.

PTX06-1046 and PTX06-1047A were installed on Texas Tech property in 2000. RDX concentrations have exceeded GWPS in PTX06-1046 since monitoring began in 2000 and have increased from approximately 500 to over 3,000 ug/L in 2015. RDX was initially non-detect in PTX06-1047A, installed approximately 300 feet south of PTX06-1046, until concentrations rapidly increased in 2006. RDX levels in PTX06-1047A appear to have peaked in 2012 at over 600 ug/L and have since dramatically decreased to near the GWPS in the most recent data. While these trends conflict with the general north-south gradient believed to be driving groundwater movement in the area, the measured concentrations have been somewhat stable for more than one year.

PTX06-1120 and PTX06-1121 were installed east of the Southeast ISB system in 2007 and were considered to be dry when completed; however, water appeared in both wells when measured in 2008 and routine sampling commenced in 2010. RDX concentrations have ranged from approximately 2,000 to 4,000 ug/L in PTX06-1120 and from about 800 to 1,300 ug/L in PTX06-1121. RDX data in PTX06-1120 indicate a decreasing trend. PTX06-1121 has not been sampled since 2012 because of insufficient water.

PTX06-1146 and PTX06-1147 were installed along the eastern edge of the estimated perched extent in 2008. When sampling began in 2009, RDX concentrations in PTX06-1146 were around 1,400 ug/L and increased until early 2011 when the concentrations appeared to have peaked. RDX may now be exhibiting a decreasing trend to near 1,000 ug/L in the most recent samples from PTX06-1146. RDX concentrations in PTX06-1147, installed approximately 3,800 feet south/southwest of PTX06-1146, increased from approximately 400 ug/L to over 1,000 ug/L from 2009 through 2013. RDX concentrations significantly decreased during 2014, but have since increased to slightly above 1,000 ug/L in 2015.

IV. Pumping Effects

If the perched groundwater elevation contours are compared from 2009 to 2015 (Attachment 1), positive effects of pump and treat operations are apparent, including the reduction of the mound of groundwater beneath Playa 1 and a general shift of groundwater contours to the north in the SEPTS well field indicating reduction of saturated thickness. Further south, perched groundwater elevation contours have remained constant or actually shifted to the southeast in the extreme southeast lobe of perched groundwater because of the observed increase of saturated thickness in PTX06-1034. The other noticeable change in the maps is the apparent spread of the dry zone located south of the SEPTS well field caused by the decline of saturated thickness observed at PTX06-1102 and PTX06-1030. This dry zone will likely continue to expand as pump and treat operations continue to reduce saturated thickness of the perched aquifer upgradient of this area.

These observations are also supported by the 2015 Capture Zone analysis results which are depicted in Figure 2. The capture zones represent areas of influence over a five-year pumping period using 2015 well operational data coupled with a single layer groundwater model specifically developed for evaluating remedial options in the perched aquifer. While the area of influence did slightly expand to the east from 2012 to 2015 (likely due to an emphasis on operating the wells along FM 2373 and possible dewatering of the perched aquifer in the extraction well field), a large area to the east remains unaffected by SEPTS system operations.

As suggested in the 2014 Hydrologic Evaluation (Pantex 2015), Pantex has plans to extend SEPTS extraction east of FM 2373 to limit further migration of impacted perched water southward along the eastern margin of the perched aquifer. Extending the SEPTS well field to the east across FM 2373 may reduce head and thus groundwater flux before it reaches areas with lower transmissivity where pump and treat technologies are less effective. This action is in agreement with the selected remedy for the southeast perched groundwater. The ROD selected the SEPTS as the final remedy to stabilize migration and treat perched groundwater contaminants.

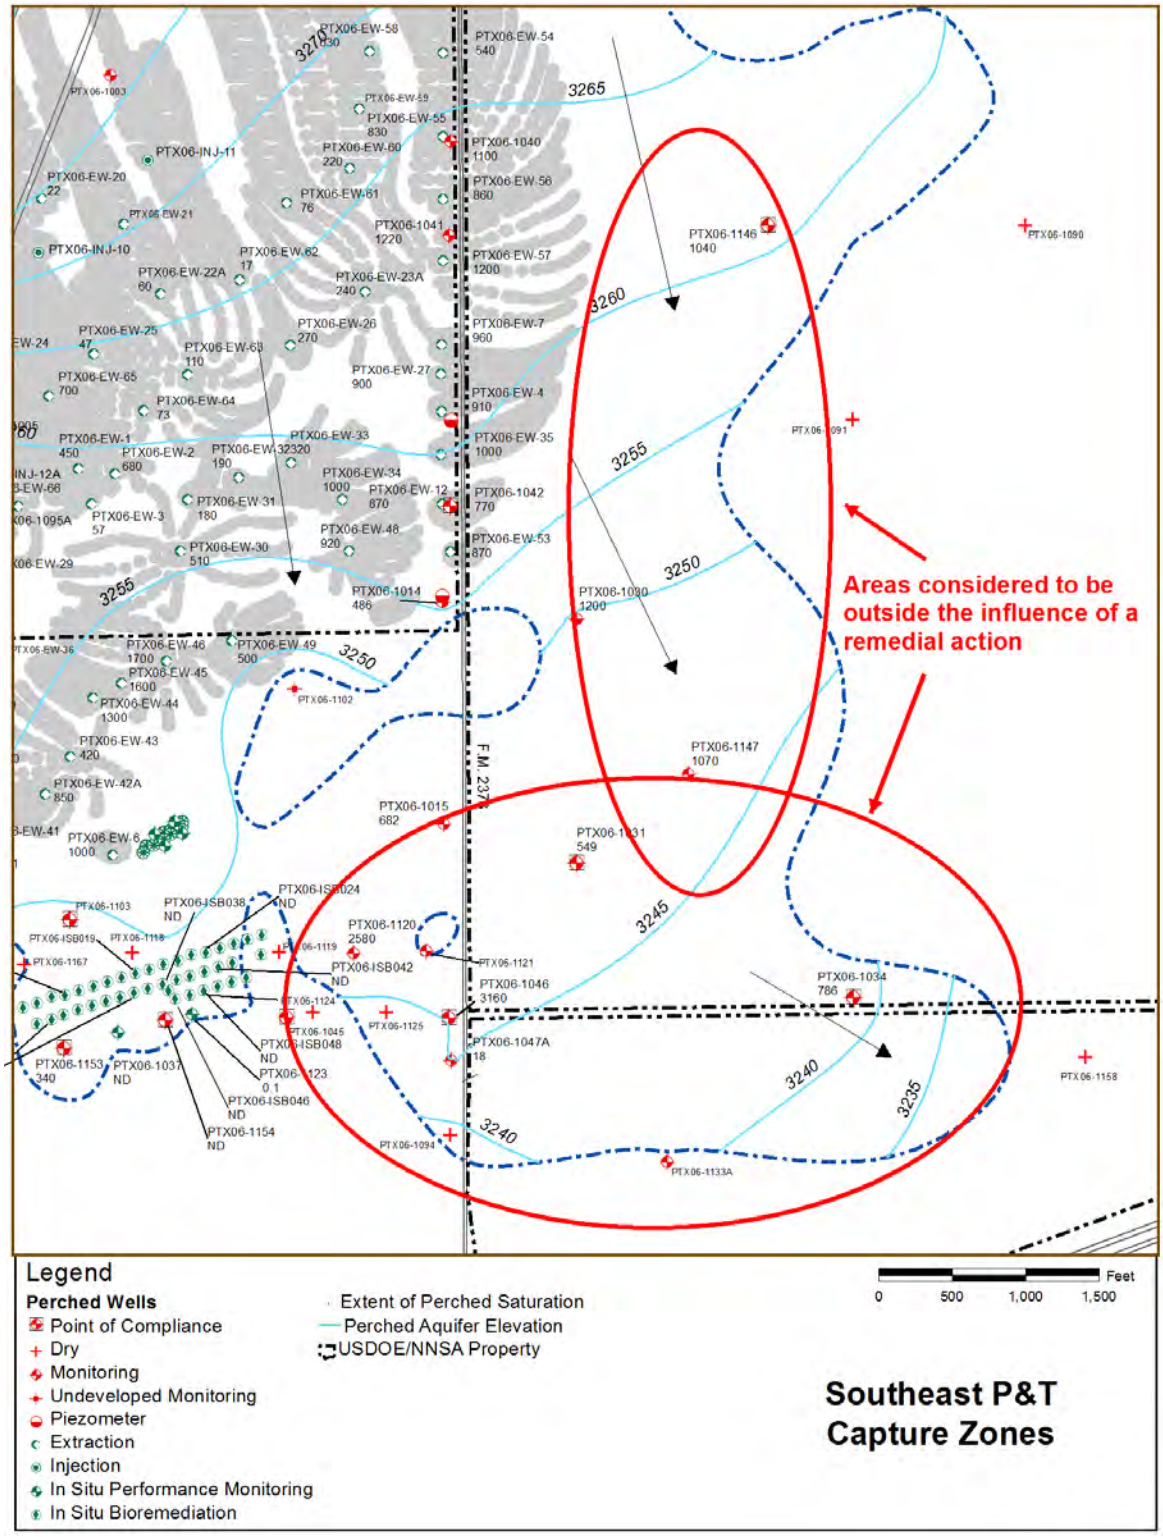

Figure 2. SEPTS Captures Zones

V. Indicators of Plume Movement

In order to evaluate and attempt to quantify plume movement in the areas that are unlikely to be affected by pump and treat operations, RDX concentrations were plotted over time on the same axis for:

- PTX06-1030
- PTX06-1031
- PTX06-1034
- PTX06-1147

These wells were chosen because they are generally located in a line following the groundwater gradient in the area, which shifts from southerly (in the northern region) to southeasterly (in the southern region).

As depicted in Figure 3, RDX data have been collected in PTX06-1030 and PTX06-1031 since 1996. At that time, the RDX plume had already reached PTX06-1030 because, with the exception of a single data point, the concentrations consistently exceeded 200 ug/L. Concentrations subsequently increased to values ranging around 1,500 ug/L, increased sharply in 2011, and are now exhibiting a somewhat stable trend at about 1,000 ug/L. In PTX06-1031, RDX concentrations were at or near detection limits until 1998, then gradually increased through 2008, and are now stable around 500 ug/L.

RDX was non-detect in PTX06-1034, currently the furthest downgradient sampled well installed in the area, until 2002, then concentrations began to steadily increase. In 2010, concentrations began increasing at a much faster rate and are now over 700 ug/L. The rate of increase in concentrations appears to be much faster than the rate at PTX06-1031 and concentrations are now slightly higher than high values observed at PTX06-1031. Therefore, it appears that the RDX detected in PTX06-1034 more likely migrated from the perched groundwater to the east represented by PTX06-1147.

High concentrations of RDX had already reached PTX06-1147 when installed in 2009. Concentrations in this well, installed between PTX06-1030 and PTX06-1034 but shifted to the east, increased from approximately 400 ug/L to over 1,200 ug/L in 2011. Recent data indicate that RDX concentrations are variable in this well.

If the RDX concentration of approximately 400 ug/L depicted on Figure 3 is chosen as representative of the leading edge of the RDX plume and considering the temporal changes in concentration discussed above, the RDX plume appears to moving downgradient at a rate of 100 to 200 ft/yr from PTX06-1030 to PTX06-1034. This rate of transport appears to be faster than groundwater velocities estimated for the SEISB conceptual site model, but similar to those groundwater velocities estimated for the Zone 11 ISB conceptual site model (Aquifer Solutions 2011). Note that the ISB velocities were estimated using slug testing techniques in ISB injection wells, which may or may not be representative of conditions in the surrounding formation.

PTX06-1133A was dry when installed in 2009 and remained dry until 2011, when approximately 3 feet of water entered the well. Observed water levels subsequently declined through 2013 when the water level dropped below the bottom of the well screen. This well was sampled from December 2011 through May 2013; all VOCs and HEs were non-detect in those samples. These water level measurements and analytical results could suggest that the perched extent was slowly expanding in the area and "old" perched groundwater, unaffected by Pantex Plant operations, had now moved into this well. Alternatively, these data could indicate the influence of enhanced recharge following the very high rainfall that occurred in 2010 through the large borrow pit located further south near U.S. Highway 60. However, because this well is apparently dry again, it is unknown whether the temporary saturated condition in the well was caused by an expanding extent of perched groundwater from the north or south, or by some other unknown phenomena. This well will continue to be monitored and will be sampled if sufficient water is available to support sample collection.

As summarized in Figure 4, the wells in the far southeastern lobe of perched groundwater are exhibiting various statistical trends in RDX considering the 2009 – 2015 data. However, as shown in Figure 3, RDX concentrations in these wells are somewhat stable over the past few years. These conditions may be caused by mass removal upgradient and some mixing with unaffected water in the region.

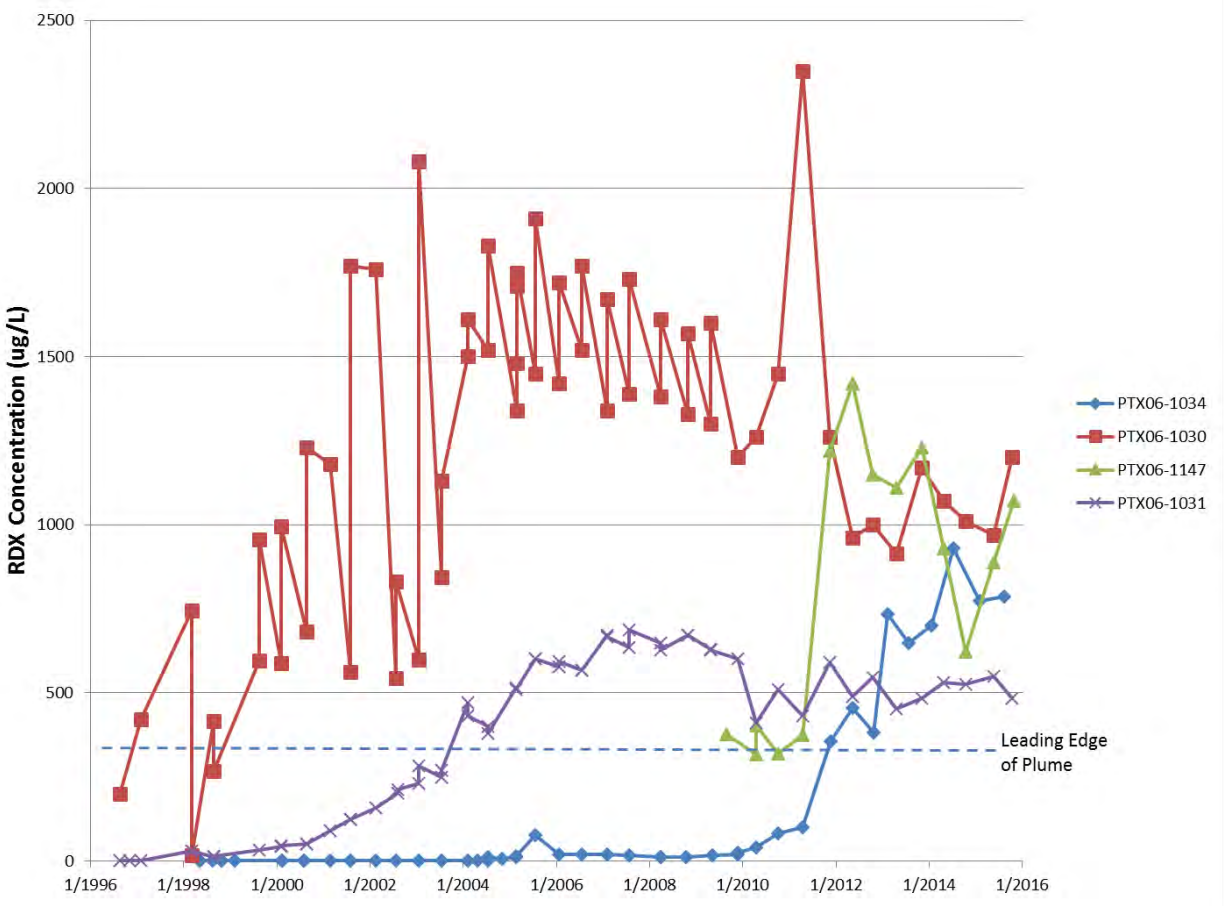

Figure 3. RDX Concentrations over time, Southeast Perched Aquifer Wells

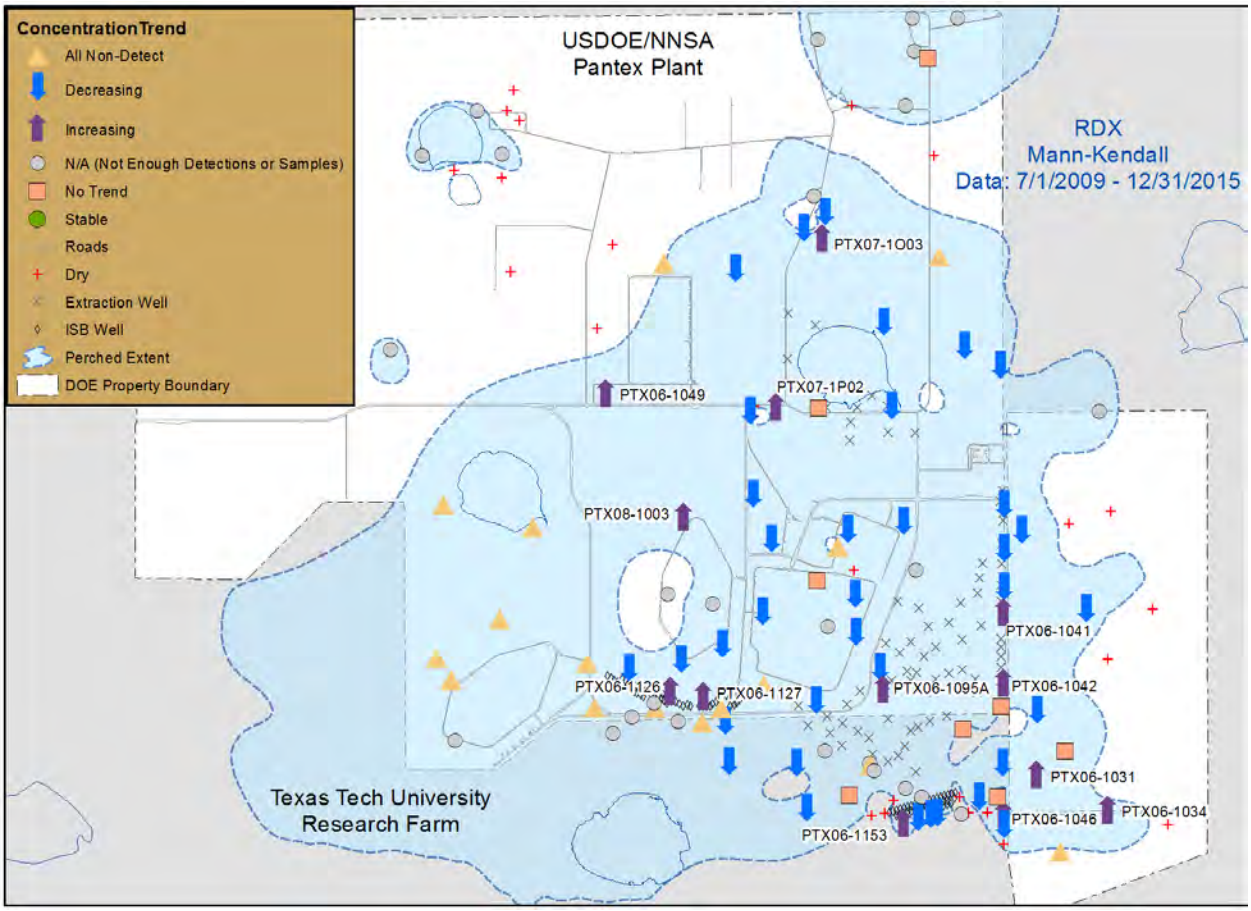

Figure 4. Recent RDX Trends in the Perched Aquifer

VI. Results of Pump Testing

To further investigate the potential for expansion of the existing SEPTS well field to the east of FM 2373, Pantex contracted for the installation and testing of two new wells located adjacent PTX06-1147. The wells were completed as monitor wells, but were constructed to extraction well specifications to facilitate future conversion for use as extraction wells. The wells were drilled near PTX06-1147 based on the results of aquifer tests conducted in 2014 that indicated the southern area near PTX06-1147 was more conductive than the northern zone represented by PTX06-1146. Complete details of well drilling, test methods, and analyses are presented in the Implementation Report for Pump Test East of FM 2373 (TriHydro 2015).

Testing included a step-drawdown test of PTX06-1178 followed immediately by an aquifer pumping test. Water levels in both PTX06-1147 and PTX06-1179 were monitored during both tests. The aquifer pumping test was conducted using a flow rate of 4.0 gpm based on the step-drawdown test and was terminated after 34 hours of pumping because drawdown in the pumping well was greater than anticipated and the water level dropped below the level of the pressure transducer. Minimal drawdown was observed at the test observation wells located approximately 50 and 100 feet from the pumping well.

A step-drawdown test was also conducted at PTX06-1179 to evaluate potential extraction flow rates because the flow rates obtained at PTX06-1178 were lower than expected based on the previous testing of PTX06-1147.

The estimated transmissivity of the perched aquifer in this area is 100 ft^2/day based on the aquifer pumping test conducted at PTX06-1178. This transmissivity corresponds to a hydraulic conductivity of 7 ft/day based on the observed 14-feet of saturated thickness at the well. This value is similar to the pre-injection values derived from slug tests conducted at the Southeast and Zone 11 ISB systems. The maximum sustained pumping rate estimated from these tests is 3 to 4 gpm. A higher flow rate of about 6 gm was sustained during the 2014 pumping test at PTX06-1147, but the saturated thickness was about one foot greater at that time.

A preliminary capture zone analysis, based on the aquifer test results, indicated an estimated capture zone width of 300 to 800 feet for an extraction well installed in this area.

VII. Conclusions

The evaluation of data presented in this report lead to several important conclusions. First, given the current configuration of the SEPTS well field, the system will not be able to affect water levels, spread of the perched aquifer, or COC mass currently in the southeast lobe of the perched aquifer. Monitoring data collected since 2008 in wells located within the southeast lobe of the perched aquifer indicate the continued movement of the RDX plume into this area. Water will continue to flow into this area from the north (supported by recent data from PTX06-1034) under the influence of the general hydraulic gradient, increasing both water volume and COC mass, which will likely continue to slowly spread throughout this zone of perched groundwater.

Therefore, several options could be considered for this region depending on the risk associated with COCs exceeding the GWPS in this area. An in-situ treatment technology could be utilized to treat the current mass or encourage natural attenuation processes in the area, or groundwater extraction technologies could be employed. Although sustainable pumping rates are estimated to be low, the installation of extraction wells east of FM 2373 in areas that have a saturated thickness exceeding 15 feet would remove COC mass and ultimately reduce flux to the south by reducing the gradient and thus the driving head of affected water movement into this area. Experience with the SEPTS has shown that wells with lower flow rates can, over time, provide demonstrable positive impacts for remediation of the perched groundwater. Pump testing conducted in 2015 indicates that the perched aquifer in the vicinity of PTX06-1147 can support extraction at flow rates in the range of 3 to 4 gpm.

Assuming that the current SEPTS conveyance system lines could be used, the cost per unit mass removal of extending the SEPTS east of FM 2373 would be significantly lower than installing an in-situ treatment system. Additionally, the Pantex Renewable Energy Project can provide some of the needed infrastructure for power to these extraction wells. Therefore, it is recommended that Pantex proceed with plans to extend the SEPTS into this area.
